

Decision Accountability Standard - (DAS)

OriginID: OOF-OID-AGA-DAS-2026-06-17-0015
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Decision Accountability Governance Layer
Governed Space: Decision Accountability
Category: Governance & Enforcement
Subcategory: Accountability Governance
Type: Parent Standard
Version: 1.0
Status: Canonical · Open Standard
Origin Date: 17 June 2026
Compatibility: OOF Methodology OS · Accountability Governance Architecture (AGA™) · Accountability Governance Standard (AGS-A) · Responsibility Traceability Standard (RTS) · Evidence Accountability Standard (EAS) · Chain of Control Standard (CCS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Decision Accountability Standard (DAS) defines the structural conditions under which decisions, decision authorities, decision processes, decision inputs, decision approvals, decision outcomes, and decision-governance activities remain attributable, accountable, traceable, reconstructable, reviewable, governable, enforceable, and operationally valid throughout the decision lifecycle.

DAS governs decision accountability.

The standard establishes the foundational conditions required to determine who made a decision, who approved a decision, under what authority the decision was made, what information was used, what consequences emerged, and who remains accountable for the decision.

A decision may be executed.

A decision may be delegated.

A decision may be approved.

DAS governs accountability for the decision.

A. Standard Abstract

Most governance failures eventually lead to one question:

Who made the decision?

Organizations often know:

- what happened
- who executed the action
- what outcome occurred

But cannot determine:

- who decided
- who approved
- who authorized
- who accepted decision risk
- who remains accountable

DAS exists to govern these conditions.

B. Core Principle

Decision accountability remains governance-valid only when decisions remain attributable to identifiable decision-makers and accountable governance structures throughout the decision lifecycle.

C. Scope

This standard may apply to:

- organizations
- institutions
- governments
- boards
- management systems
- contractor networks
- compliance environments
- AI governance systems
- autonomous-agent systems
- Human-AI decision environments
- future intelligent governance systems

DAS applies wherever decisions influence outcomes.

D. Why This Standard Exists

Many systems record actions.

Few systems preserve decision accountability.

Common failures include:

- anonymous decisions
- undocumented approvals
- unclear decision authority
- hidden decision pathways
- governance-blind decisions
- AI-assisted decision ambiguity
- accountability fragmentation
- decision reconstruction failures

The challenge is not determining that a decision occurred.

The challenge is determining who remains accountable for the decision.

DAS exists because decision accountability is a distinct governance space.

E. Decision Accountability Integrity Logic

Decision accountability integrity exists only when the following remain materially preservable:

1. Decision Origin Integrity

The decision remains attributable to a legitimate decision source.

2. Decision Scope Integrity

The decision remains connected to clearly defined decision boundaries.

3. Decision Validity Integrity

The decision remains legitimate, authorized, and governance-valid.

4. Decision Traceability Integrity

The decision remains reconstructable throughout the decision lifecycle.

5. Decision Accountability Integrity

The decision remains connected to accountable governance structures.

F. Operational Architecture Space

DAS defines the operational architecture space for:

- decision accountability
- decision ownership
- decision governance
- approval accountability
- authorization accountability
- decision traceability
- Human-AI decision accountability
- AI-assisted decision governance
- governance decision reconstruction
- consequence attribution

This space exists because governance ultimately requires accountability for decisions.

DAS governs whether decisions remain accountable.

G. Difference Between Accountability and Decision Accountability

Accountability Governance asks:

Who remains answerable?

Decision Accountability asks:

Who remains answerable for the decision?

AGS-A governs accountability generally.

DAS governs accountability specifically for decisions.

Both are required.

H. Runtime Position

DAS operates within the Accountability Layer of AGA™.

It follows:

- Accountability Governance Standard (AGS-A)
- Responsibility Traceability Standard (RTS)
- Evidence Accountability Standard (EAS)

and supports:

- Accountability Continuity Standard (ACS)
 - Accountability Chain Standard (ACS-C)
-

DAS governs accountability for decision-making.

I. Decision Accountability Failure Rule

Decision accountability failure occurs when decisions cannot be reliably attributed, reconstructed, reviewed, governed, validated, enforced, or connected to accountable governance structures.

Examples include:

- anonymous decisions
- undocumented approvals
- authority ambiguity
- hidden decision-makers
- governance-blind decision pathways
- AI decision opacity
- accountability fragmentation

DAS exists to expose and govern these conditions.

J. Validity Logic

A decision-accountability environment is valid under DAS when:

- decision-makers remain identifiable
- decision authority remains visible
- decision pathways remain reconstructable
- decision approvals remain reviewable
- accountability relationships remain preservable
- governance oversight remains possible

A decision-accountability environment becomes invalid when:

- decision-makers become unknown
 - authority becomes unverifiable
 - decision history disappears
 - approvals become unreconstructable
 - accountability relationships are lost
-

K. Relationship to Other OOF Standards

DAS derives from:

- Accountability Governance Standard (AGS-A)
 - Responsibility Traceability Standard (RTS)
 - Evidence Accountability Standard (EAS)
-

and supports:

- Accountability Continuity Standard (ACS)
- Accountability Chain Standard (ACS-C)

AGS-A governs accountability.

DAS governs accountability for decisions.

L. Foundational Principle

Governance cannot remain trustworthy if decisions cannot be connected to accountable decision-makers.

Canonical Closing Statement

Decision Accountability Standard (DAS) defines the structural conditions under which decisions, decision authorities, decision processes, decision inputs, decision approvals, decision outcomes, and decision-governance activities remain attributable, accountable, traceable, reconstructable, reviewable, governable, enforceable, and operationally valid throughout the decision lifecycle.

Actions may create outcomes, but decisions create actions. Decision Accountability therefore becomes a foundational condition of trustworthy governance systems and trustworthy accountability attribution.
