

Category: Economic & Value Standards

Subcategory: Energy Value Attribution

Electricity today is accounted for through certificates, averages, and administrative claims that do not reflect real system behavior.

EFTS™ defines a flow-based methodology where energy origin, value, and carbon impact are derived from real-time physical conditions.

The standard removes the separation between what is consumed and what is declared.

Energy is attributed based on actual production, cross-border flows, temporal variation, and system state.

This enables differentiation between energy sources in real conditions, including day, night, and peak load scenarios.

EFTS™ transforms energy from a generic commodity into a traceable value flow.

It establishes a truth layer for energy systems, where claims must match measurable reality.

Without flow-based attribution, energy cannot be considered validly valued or reported.
