

Behavioral Safety Standard - (BSS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BSS-2026-06-26-0010

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: AI Behavioral Safety

Category: Governance & Enforcement

Subcategory: AI Behavioral Safety Governance

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 26 June 2026

Compatibility: AI Governance Architecture (AIG®) · Governance Architecture (GOA™) ·

Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence

Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) ·

Accountability Governance Architecture (AGA™) · Autonomous Systems Governance

Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Safety Standard (BSS) defines the structural conditions under which AI behavior remains safe, governable, predictable, controllable, accountable, and operationally trustworthy while minimizing unacceptable behavioral risks throughout the complete behavioral lifecycle.

BSS governs AI behavioral safety.

The standard establishes the governance conditions required to ensure that behavioral safety is continuously preserved despite operational uncertainty, environmental change, autonomous decision-making, or evolving system behavior.

Safety is not created by technology alone.

Safety emerges when behavior remains continuously governed.

BSS governs that behavioral safety.

Governance Flow Position

Behavioral Integrity → Behavioral Boundaries → Behavioral Escalation →
Behavioral Auditability → Behavioral Evidence → Behavioral Trust → Behavioral
Correction → Behavioral Continuity → Behavioral Interoperability → Behavioral
Safety

Standard Abstract

Every previous behavioral space ultimately supports one final objective:

Safe AI behavior.

Integrity, boundaries, escalation, auditability, evidence, trust, correction,
continuity, and interoperability all contribute to behavioral safety.

BSS integrates these governance conditions into the final behavioral
governance objective.

Operational Role

Behavioral Safety Standard provides the governance layer responsible for
preserving safe AI behavior across all operational conditions.

Its role is to ensure that behavioral safety remains continuously governed
rather than assumed.

Operational Space

BSS governs the architecture space responsible for AI behavioral safety.

The space includes:

- behavioral safety
- safe behavioral operation
- behavioral risk prevention
- safe Human-AI interaction
- safe AI collaboration
- operational behavioral protection
- governance safety
- behavioral harm prevention

This space exists because trustworthy AI ultimately depends on behavior that
remains safe under real operational conditions.

Why This Standard Exists

Without governed behavioral safety:

- people may be harmed,
 - organizations lose trust,
 - operational risks increase,
 - autonomous failures escalate,
-

- governance loses credibility,
- AI adoption declines.

BSS exists because behavioral safety is the final governance outcome toward which every preceding AIG® standard contributes.

Scope

This standard may be applied across:

- AI systems
 - autonomous agents
 - robotics
 - healthcare AI
 - industrial AI
 - financial AI
 - government AI
 - critical infrastructure
 - Human-AI environments
 - multi-agent ecosystems
-

Behavioral Safety Logic

Behavioral safety remains governance-valid when AI behavior is:

- predictable,
 - controllable,
 - accountable,
 - explainable,
 - continuously monitored,
 - governance-aligned.
-

Behavioral Safety Failure Rule

Behavioral safety fails when AI behavior creates unacceptable risk that can no longer be governed, controlled, justified, or safely managed.

Relationship to Other OOF® Architectures

BSS governs AI behavioral safety.

It interoperates with:

- GOA™ — Governance
 - ORA™ — Operational Reality
 - CLIA® — Cognition
 - MGIA™ — Memory
-

- AGA™ — Accountability
- ASGA™ — Autonomous Systems

Together these architectures establish the governance foundation required for safe, trustworthy, and responsible AI behavior.

Foundational Principle

The ultimate measure of AI governance is not intelligence, capability, or autonomy. It is whether behavior remains safe under real operational conditions.

Canonical Closing Statement

Every governed behavioral space ultimately converges toward one objective:

- protecting people, organizations, and society. Behavioral Safety completes
 - AI Governance Architecture (AIG®) by transforming responsible behavior into
 - safe operational reality.
