

Behavioral Trust Standard - (BTS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BTS-2026-06-26-0006

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: AI Behavioral Trust

Category: Governance & Enforcement

Subcategory: AI Behavioral Trust Governance

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 26 June 2026

Compatibility: AI Governance Architecture (AIG®) · Governance Architecture (GOA™) ·

Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence

Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) ·

Accountability Governance Architecture (AGA™) · Autonomous Systems Governance

Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Trust Standard (BTS) defines the structural conditions under which AI behavior becomes, remains, loses, and restores trust through consistent governance, observable integrity, accountable operation, reliable evidence, and verifiable behavioral performance throughout the complete behavioral lifecycle.

BTS governs AI behavioral trust.

The standard establishes the governance conditions required to ensure that trust is treated as a measurable governance outcome rather than an assumption, expectation, or marketing claim.

Trust is not declared.

Trust is earned through behavior.

BTS governs the conditions under which that trust exists.

Governance Flow Position

Behavioral Integrity → Behavioral Boundaries → Behavioral Escalation →
Behavioral Auditability → Behavioral Evidence → Behavioral Trust → Behavioral
Correction → Behavioral Continuity → Behavioral Interoperability → Behavioral
Safety

Standard Abstract

Trust determines whether organizations, regulators, employees, customers, and society are willing to rely on AI behavior.

Trust cannot be imposed.

It emerges when AI behavior consistently demonstrates integrity, transparency, accountability, evidence, and governance maturity.

BTS establishes the governance architecture that transforms trustworthy behavior into sustainable organizational trust.

Operational Role

Behavioral Trust Standard provides the governance layer responsible for evaluating, preserving, strengthening, and restoring trust in AI behavior.

Its role is to ensure that trust becomes an observable governance condition supported by evidence rather than perception.

Operational Space

BTS governs the architecture space responsible for AI behavioral trust.

The space includes:

- behavioral trust
- trust establishment
- trust preservation
- trust degradation
- trust recovery
- governance confidence
- organizational trust
- stakeholder trust

This space exists because AI adoption ultimately depends on trusted behavior rather than technological capability.

Why This Standard Exists

Organizations increasingly delegate important decisions to AI systems.

Without behavioral trust:

- adoption slows,
- governance credibility declines,
- regulatory confidence weakens,
- organizational acceptance decreases,
- operational risk increases,
- Human-AI collaboration deteriorates.

BTS exists because trust is a governable behavioral space that determines whether AI can be responsibly relied upon.

Scope

This standard may be applied across:

- AI systems
 - autonomous agents
 - robotics
 - enterprise AI
 - healthcare AI
 - financial AI
 - industrial AI
 - government AI
 - Human-AI environments
 - multi-agent ecosystems
-

Behavioral Trust Logic

Behavioral trust exists when AI behavior remains:

- consistent,
- transparent,
- accountable,
- evidence-supported,
- explainable,
- governance-valid.

Trust degrades when these conditions are no longer maintained.

Behavioral Trust Failure Rule

Behavioral trust fails when AI behavior can no longer justify confidence through observable governance, verifiable evidence, accountable operation, or consistent behavioral performance.

Relationship to Other OOF® Architectures

BTS governs AI behavioral trust.

It interoperates with:

- GOA™ — Governance
- ORA™ — Operational Reality
- CLIA® — Cognition
- MGIA™ — Memory
- AGA™ — Accountability
- ASGA™ — Autonomous Systems

Together these architectures establish the governance foundations required for trustworthy AI.

Foundational Principle

Trust is not a feature of Artificial Intelligence. Trust is the result of consistently governable behavior.

Canonical Closing Statement

Trust cannot be engineered into AI by declaration. It emerges when behavior consistently demonstrates integrity, accountability, transparency, and evidence. Behavioral Trust transforms responsible AI behavior into enduring confidence.
