

GCIM — Governance Conflict of Interest Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GIS-GCIM-2026-06-22-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Governance Flow Position: Authority → Boundary → Scope →

Delegation → Accountability → Validation → Integrity → Transparency →

Continuity → Interoperability

Operational Layer: Governance Integrity Layer

Governed Space: Governance Conflict of Interest

Category: Governance & Enforcement

Subcategory: Governance Integrity Governance

Type: Governance Integrity Standard Module

Parent Standard: Governance Integrity Standard (GIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Integrity Standard (GIS)

· Governance Validation Standard (GVS) · Governance Accountability Standard (GAS-A)

· Governance Transparency Standard (GTS) · INTEGROAS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Governance Conflict of Interest Module (GCIM) defines the structural conditions under which governance conflicts of interest remain identifiable, detectable, attributable, reviewable, governable, auditable, traceable, and operationally valid throughout the governance lifecycle.

GCIM governs governance conflicts of interest.

The module establishes the foundational conditions required to identify actual, potential, perceived, direct, indirect, and hidden conflicts of interest before they compromise governance integrity, governance decisions, governance accountability, or governance trustworthiness.

Governance may be valid.

Conflicts of interest may invalidate governance.

GCIM governs those conflicts.

Module Operational Role

GCIM defines the governance-conflict-of-interest layer of GIS.

Its role is to preserve governance impartiality and governance independence throughout governance environments.

Module Operational Space

GCIM governs:

- governance conflict-of-interest detection
- governance independence
- governance impartiality
- hidden influence identification
- governance bias detection
- governance-interest transparency
- governance conflict traceability
- governance conflict governance

The module applies wherever governance decisions may be influenced by competing interests.

Module Function

The module applies wherever systems must preserve:

- impartial governance decisions
- identifiable conflicts of interest
- traceable governance influences
- reconstructable conflict history
- governance-valid conflict records
- operational governance independence

Its function is to ensure that governance decisions remain free from undisclosed or unmanaged conflicts of interest.

Minimum Implementation Framework

1. Define the Governance Conflict Object

The organization must define which governance environments require conflict-of-interest governance.

This may include:

- organizations
- institutions
- governments
- regulatory authorities
- governance committees
- corporate governance structures
- AI governance systems
- Human-AI governance environments

2. Define Governance Conflict Conditions

The system must define the conditions under which governance conflicts of interest remain governable.

This includes:

- disclosure requirements
- independence requirements
- traceability requirements
- review requirements
- validation requirements
- governance-valid conflict conditions

3. Define Conflict Detection Logic

The system must define how governance conflicts of interest are identified.

This may include:

- hidden financial interests
- personal influence
- organizational influence
- competing governance roles
- undisclosed relationships
- governance-invalid influence activities

4. Define Operational Response or Governance Logic

The system must define governance logic for governance conflict-of-interest events.

Governance response may include:

- conflict review
- independent assessment
- governance intervention
- recusal procedures
- corrective actions
- governance reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- conflict disclosures
- conflict reviews
- governance interventions
- recusal procedures
- validation activities
- resulting governance states

A governance environment must not remain integrity-valid if materially significant conflicts of interest cannot be identified, reviewed, disclosed, validated, preserved, or governed.

Use Case 1 — Board Governance

Scenario

A board member participates in a governance decision involving an organization in which they have an undisclosed financial interest.

Application

GCIM identifies the conflict, governs disclosure requirements, and initiates appropriate governance responses.

Result

The organization gains stronger governance independence, reduced integrity risk, and improved governance trustworthiness.

Use Case 2 — Human-AI Governance Environment

Scenario

An AI governance system recommends governance actions influenced by biased training data or undisclosed optimization objectives.

Application

GCIM governs hidden-influence detection, conflict assessment, and Human-AI governance impartiality.

Result

The organization gains stronger governance objectivity, reduced hidden influence, and improved Human-AI governance integrity.

Canonical Closing Statement

Governance Conflict of Interest Module (GCIM) defines the structural conditions under which governance conflicts of interest remain identifiable, detectable, attributable, reviewable, governable, auditable, traceable, and operationally valid throughout the governance lifecycle.

Governance cannot remain trustworthy where unmanaged conflicts of interest remain hidden. Governance Conflict of Interest therefore becomes a foundational condition of trustworthy governance integrity governance.
