

GCorM — Governance Correction Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GVS-GCORM-2026-06-22-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Governance Flow Position: Authority → Boundary → Scope →

Delegation → Accountability → Validation → Integrity → Transparency →

Continuity → Interoperability

Operational Layer: Governance Validation Layer

Governed Space: Governance Correction

Category: Governance & Enforcement

Subcategory: Governance Validation Governance

Type: Governance Validation Standard Module

Parent Standard: Governance Validation Standard (GVS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Validation Standard (GVS)

· Governance Integrity Standard (GIS) · Governance Accountability Standard (GAS-A) ·

Governance Transparency Standard (GTS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Governance Correction Module (GCorM) defines the structural conditions under which governance errors, governance failures, governance inconsistencies, governance-control deficiencies, governance-process defects, and governance-invalid conditions remain identifiable, correctable, traceable, reviewable, governable, auditable, and operationally valid throughout the governance lifecycle.

GCorM governs governance correction.

The module establishes the foundational conditions required to determine how governance-invalid conditions are corrected, who performs corrective governance actions, how governance corrections are validated, and whether governance-correction activities remain reconstructable throughout operational reality.

Governance may be validated.

Validation may reveal invalid conditions.

Governance must then be capable of correction.

GCorM governs that correction.

Module Operational Role

GCorM defines the governance-correction layer of GVS.

Its role is to establish governance-valid corrective capability throughout governance environments.

Module Operational Space

GCorM governs:

- governance correction
- governance remediation
- governance-error correction
- governance-failure response
- governance-defect resolution
- governance-improvement actions
- governance traceability
- governance-correction reconstruction

The module applies wherever governance-invalid conditions require corrective action.

Module Function

The module applies wherever systems must preserve:

- correctable governance conditions
- traceable corrective actions
- reconstructable correction history
- attributable correction ownership
- governance-valid correction records
- operational governance improvement

Its function is to ensure that governance remains capable of correcting invalid governance conditions.

Minimum Implementation Framework

1. Define the Governance Correction Object

The organization must define which governance environments require governance-correction governance.

This may include:

- organizations
- institutions
- governments
- regulatory environments
- governance committees
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Governance Correction Conditions

The system must define the conditions under which governance corrections remain valid.

This includes:

- correction requirements
- remediation requirements
- traceability requirements
- validation requirements
- review requirements
- governance-valid correction conditions

3. Define Correction Degradation Detection Logic

The system must define how governance-correction failures are identified.

This may include:

- unresolved governance failures
- ineffective corrective actions
- undocumented corrections
- unverifiable remediation activities
- recurring governance defects
- governance-invalid correction activities

4. Define Operational Response or Governance Logic

The system must define governance logic for governance-correction failures.

Governance response may include:

- correction review
- governance intervention
- corrective actions
- remediation procedures
- correction validation
- governance reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- governance corrections
- remediation activities
- governance reviews
- intervention procedures
- validation activities
- resulting governance states

A governance environment must not remain correction-valid if materially significant governance corrections cannot be reconstructed, reviewed, validated, attributed, preserved, or governed.

Use Case 1 — Governance Process Failure

Scenario

An organization discovers that a governance process repeatedly produces invalid governance outcomes and requires remediation.

Application

GCorM governs corrective actions, remediation procedures, and governance-improvement activities.

Result

The organization gains stronger governance resilience, reduced governance defects, and improved governance reliability.

Use Case 2 — Human-AI Governance Environment

Scenario

A Human-AI governance environment identifies governance-control failures requiring immediate corrective action and governance remediation.

Application

GCorM governs governance correction, remediation procedures, and Human-AI governance recovery activities.

Result

The organization gains stronger governance adaptability, reduced governance risk, and improved Human-AI governance reliability.

Canonical Closing Statement

Governance Correction Module (GCorM) defines the structural conditions under which governance errors, governance failures, governance inconsistencies, governance-control deficiencies, governance-process defects, and governance-invalid conditions remain identifiable, correctable, traceable, reviewable, governable, auditable, and operationally valid throughout the governance lifecycle.

Governance that cannot correct itself cannot remain sustainably valid. Governance Correction therefore becomes a foundational condition of trustworthy governance validation governance.
