

Governance Scope Standard - (GSS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GSS-2026-06-22-0003

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Scope Layer

Governed Space: Governance Scope

Category: Governance & Enforcement

Subcategory: Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 22 June 2026

Compatibility: Governance Architecture (GOA™) ·

Intelligence Governance Architecture (IGA™) ·

Accountability Governance Architecture (AGA™) ·

AI Governance Architecture (AIG™) ·

Autonomous Systems Governance Architecture (ASGA™) ·

Audit in Real Time (ART™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Governance Scope Standard (GSS) defines the structural conditions under which governance scope remains identifiable, attributable, legitimate, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

GSS governs governance scope.

The standard establishes the foundational conditions required to determine what governance may legitimately govern, what governance may not govern, what objects belong within governance scope, and what objects remain outside governance scope.

Governance authority may exist.

Governance authority may have boundaries.

Governance authority must also have scope.

GSS governs that scope.

A. Standard Abstract

Governance does not apply to everything.

Every governance system operates within a defined governance scope.

Governance scope determines which activities, decisions, actors, systems, assets, processes, environments, and responsibilities fall within governance jurisdiction.

Failures frequently occur when governance scope becomes unclear, excessive, incomplete, disputed, or invalid.

GSS exists to govern these conditions.

B. Core Principle

Governance remains governance-valid only when governance scope remain identifiable, legitimate, enforceable, and reconstructable.

C. Scope

This standard may apply to:

- organizations
- institutions
- governments
- regulatory systems
- corporate governance environments
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments
- robotics environments
- future governance ecosystems

GSS applies wherever governance must determine what belongs within governance jurisdiction.

D. Why This Standard Exists

Many governance failures originate from scope failures.

Common examples include:

- governance overreach
 - governance underreach
 - undefined governance responsibilities
 - governance-scope ambiguity
-

- governance ownership disputes
- unmanaged governance domains
- unauthorized governance activities
- governance blind spots

The challenge is not governance authority.

The challenge is determining what governance legitimately governs.

GSS exists because governance scope forms a distinct governance space.

E. Governance Scope Integrity Logic

Governance-scope integrity exists only when the following remain materially preservable:

- **1. Scope Definition Integrity:**
Governance scope remains clearly defined.
 - **2. Scope Ownership Integrity:**
Governance scope remains attributable to legitimate governance authority.
 - **3. Scope Validity Integrity:**
Governance scope remains governance-valid.
 - **4. Scope Enforcement Integrity:**
Governance scope remains enforceable.
 - **5. Scope Traceability Integrity:**
Governance scope remains reconstructable throughout operational reality.
-

F. Operational Architecture Space

GSS defines the operational architecture space for:

- governance-scope governance
- governance-domain governance
- governance-object governance
- governance-responsibility governance
- governance-coverage governance
- governance-expansion governance
- governance-restriction governance
- governance-scope conflict governance

This space exists because governance authority and governance boundaries alone cannot determine what governance legitimately governs.

GSS governs governance scope.

G. Difference Between Governance Boundary and Governance Scope

Governance Boundary asks:

Where does governance authority begin and end?

Governance Scope asks:

What may governance legitimately govern?

- GBS governs governance boundaries.
- GSS governs governance scope.

Both are required.

H. Runtime Position

GSS operates as the third governance-layer standard of GOA™.

It follows:

Governance Authority Standard (GAS)

Governance Boundary Standard (GBS)

It precedes:

Governance Delegation Standard (GDS)

GSS governs what governance may legitimately govern.

I. Governance Scope Failure Rule

Governance-scope failure occurs when governance coverage cannot be reliably identified, justified, reconstructed, enforced, or governed.

Examples include:

- governance overreach
 - governance underreach
 - undefined governance responsibilities
 - governance-scope ambiguity
 - unmanaged governance domains
 - governance-ownership conflicts
-

GSS exists to expose and govern these conditions.

J. Validity Logic

A governance-scope environment is valid under GSS when:

- governance scope remains identifiable
- governance coverage remains attributable
- governance responsibilities remain defined
- governance domains remain governable
- governance ownership remains preservable
- governance scope remains enforceable

A governance-scope environment becomes invalid when:

- governance scope becomes ambiguous
 - governance coverage becomes excessive
 - governance coverage becomes incomplete
 - governance responsibilities disappear
 - governance ownership becomes disputed
-

K. Relationship to Other OOF Standards

GSS derives from:

Governance Authority Standard (GAS)

Governance Boundary Standard (GBS)

and directly supports:

- Governance Delegation Standard (GDS)
- Governance Accountability Standard
- Governance Validation Standard

GAS governs who may govern.

GBS governs where governance may govern.

GSS governs what governance may govern.

L. Foundational Principle

Governance cannot remain legitimate if governance scope cannot be clearly defined.

Canonical Closing Statement

Governance Scope Standard (GSS) defines the structural conditions under which governance scope remains identifiable, attributable, legitimate, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Governance authority becomes operationally meaningful only when governance scope becomes identifiable. Governance Scope therefore becomes a foundational condition of trustworthy governance systems.
