

Group Memory Integrity Standard - (GMIS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-GMIS-2026-06-08-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Group Memory Governance Layer

Governed Space: Group Memory Integrity

Category: AI & Interpretation

Subcategory: Group Memory Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 8 June 2026

Compatibility: OOF Methodology OS · Memory Integrity Standard (MIS) ·

User Memory Integrity Standard (UMIS) · Collective Cognition Integrity Standard (CCIS) ·

Multi-Agent Cognition Integrity Standard (MCIS) · Human-AI Cognition Integrity Standard (HAICS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Group Memory Integrity Standard (GMIS) defines the structural conditions under which memory shared by a group remains coherent, continuous, reconstructable, accountable, retrievable, governable, and operationally valid throughout collaboration, communication, decision-making, coordination, and collective activity processes.

GMIS governs group memory.

The standard establishes the integrity conditions required for preserving shared memory across teams, organizations, Human-AI groups, agent collectives, operational units, and collaborative environments.

Group memory is not merely the sum of individual memories.

Group memory is the shared memory layer that enables collective continuity.

GMIS governs the integrity of that shared layer.

A. Standard Abstract

Groups depend on memory.
Teams depend on memory.
Organizations depend on memory.
Human-AI groups depend on memory.
Agent collectives depend on memory.

Without shared memory:

- coordination deteriorates
- decisions repeat
- knowledge fragments
- context disappears
- collaboration weakens
- continuity collapses

As collective intelligence systems become more common, shared memory becomes a critical governance space.

GMIS exists to govern that space.

B. Core Principle

Group memory becomes valid only when shared memory remains coherent, continuous, reconstructable, accountable, retrievable, and operationally valid throughout collective activity.

C. Scope

This standard may apply to:

- teams
- organizations
- Human-AI groups
- multi-agent environments
- operational units
- project groups
- collaborative platforms
- future collective intelligence systems

GMIS applies wherever memory is shared between multiple participants.

D. Why This Standard Exists

Individual memory is not sufficient for collective operation.

Groups require:

- shared context
 - shared history
 - shared understanding
-

- shared knowledge
- shared continuity

Without governance:

- group knowledge fragments
- context diverges
- coordination fails
- collective memory drifts
- accountability becomes unclear

GMIS exists because shared memory itself has become a governable space.

E. Group Memory Integrity Logic

Group memory integrity exists only when the following remain materially preservable:

- **1. Shared Memory Integrity:**
Shared memory remains accessible and coherent across participants.
 - **2. Group Memory Coordination Integrity:**
Memory remains synchronized throughout collaborative environments.
 - **3. Collective Recall Integrity:**
Groups remain capable of reconstructing relevant shared history.
 - **4. Group Context Integrity:**
Shared context remains aligned and operationally valid.
 - **5. Group Memory Accountability Integrity:**
Collective memory utilization remains accountable and reviewable.
-

F. Operational Architecture Space

GMIS defines the operational architecture space for:

- shared memory governance
- collective memory continuity
- group knowledge preservation
- collaborative memory systems
- shared context governance
- collective recall
- coordination memory
- group accountability

This space exists because collective operation depends on shared memory continuity.

GMIS governs whether that continuity remains valid.

G. Difference Between Individual Memory and Group Memory

Individual memory belongs to an individual.

Group memory belongs to a collective environment.

Group memory emerges through shared interaction, shared context, shared knowledge, and collective continuity.

GMIS governs this collective memory layer.

H. Runtime Position

GMIS operates above individual memory environments.

It governs memory shared between multiple participants.

GMIS supports:

- CCIS
 - MCIS
 - HAICS
 - Organizational intelligence systems
 - Collective decision environments
-

I. Group Memory Failure Rule

Group memory failure occurs when shared memory can no longer support collective continuity.

Examples include:

- knowledge fragmentation
- context divergence
- coordination breakdown
- memory inconsistency
- collective recall failure
- accountability loss

GMIS exists to expose and govern these conditions.

J. Validity Logic

A group memory environment is valid under GMIS when:

- shared memory remains coherent
 - group context remains aligned
-

- collective recall remains possible
- coordination remains supported
- accountability remains visible
- continuity remains preservable

A group memory environment becomes invalid when:

- memory fragments
- context diverges
- shared history becomes unreconstructable
- accountability disappears

K. Relationship to Other OOF Standards

GMIS derives from:

Memory Integrity Standard (MIS)

and directly supports:

- Collective Cognition Integrity Standard (CCIS)
- Multi-Agent Cognition Integrity Standard (MCIS)
- Human-AI Cognition Integrity Standard (HAICS)

GMIS governs shared memory.

CCIS and MCIS govern cognition built upon that shared memory.

L. Foundational Principle

Collective intelligence depends on collective memory. Without trustworthy group memory, collective cognition loses continuity, coordination, and operational reliability.

Canonical Closing Statement

Group Memory Integrity Standard (GMIS) defines the structural conditions under which memory shared by a group remains coherent, continuous, reconstructable, accountable, retrievable, governable, and operationally valid throughout collaboration, communication, decision-making, coordination, and collective activity processes.

Collective continuity depends on shared memory continuity. Group memory integrity therefore becomes a foundational condition of trustworthy collaboration, coordination, and collective intelligence systems.
