

About the Human-AI Cognition Integrity Standard (HAICS)

Canonical Definition

Human-AI Cognition Integrity Standard (HAICS) defines the structural conditions under which cognition emerging through interaction, cooperation, augmentation, reasoning, interpretation, decision support, and shared cognitive processes between humans and AI systems remains traceable, coherent, accountable, reality-connected, governance-valid, and operationally reliable.

Human cognition and AI cognition are distinct.

Human-AI cognition is a separate cognition space emerging between them.

HAICS governs the integrity of that space.

What This Standard Is

HAICS is a parent standard defining the governance architecture for Human-AI cognition integrity.

It governs:

- shared cognition
- cognitive augmentation
- Human-AI reasoning
- Human-AI interpretation
- cognitive authority
- trust calibration
- reliance governance
- cognition synchronization
- Human-AI accountability

HAICS establishes the conditions under which cognition jointly produced by humans and AI remains governable and operationally valid.

What This Standard Is Not

HAICS is not:

- an AI model
- a chatbot
- a copilot application
- a machine-learning framework
- a decision engine
- a collaboration platform
- an automation system

HAICS does not govern humans alone.

HAICS does not govern AI alone.

HAICS governs cognition emerging between them.

Why This Standard Exists

The next generation of cognition systems will increasingly be Human-AI systems.

Humans will interpret with AI assistance.

Humans will reason with AI support.

Humans will make decisions using AI-generated insights.

AI systems will increasingly influence cognition rather than simply provide information.

This creates new governance challenges.

For example:

- Who contributed to a conclusion?
- Who influenced a decision?
- Who remains accountable?
- Who had cognitive authority?
- How much trust was appropriate?
- Did the human understand the AI output?
- Did the AI influence the outcome disproportionately?

These questions cannot be answered by human cognition standards alone.

They cannot be answered by AI cognition standards alone.

HAICS exists because Human-AI cognition itself has become a governable space.

Core Insight

The future of cognition will increasingly emerge through cooperation between humans and AI.

The integrity of that shared cognition must therefore be governed independently of either participant.

Operational Architecture Space

HAICS defines the operational architecture space for:

- Human-AI cognition governance
- shared cognition governance
- cognitive augmentation governance
- cognitive authority governance
- trust governance
- reliance governance
- cognition synchronization
- Human-AI accountability
- collaborative cognition governance

This space exists because cognition increasingly emerges through Human-AI interaction rather than isolated cognition.

HAICS governs whether that interaction remains valid.

HAICS closes the governable space between human cognition and AI cognition.

Use Case 1 — Executive AI Copilot Environment

Scenario

Executives continuously use AI copilots to analyze information, evaluate risks, generate strategic options, and support organizational decisions.

Application

HAICS governs cognitive contributions, authority relationships, trust calibration, accountability, and decision influence throughout Human-AI cognition processes.

Result

The organization gains stronger decision transparency, improved accountability, and reduced exposure to authority ambiguity or blind trust.

Use Case 2 — Clinical Human-AI Decision Support System

Scenario

Medical professionals use AI systems to support diagnosis, treatment planning, and patient-care decisions.

Application

HAICS governs shared cognition, trust calibration, contribution traceability, and Human-AI accountability throughout clinical decision-making.

Result

The environment gains stronger governance reliability, improved decision quality, and reduced exposure to unsafe Human-AI cognition dynamics.

Architectural Position

Within the OOF system, HAICS belongs under:

AI & Interpretation

Cognitive Governance Intelligence Architecture (CLIA®)

HAICS serves as the parent standard governing Human-AI cognition.

It extends the CLIA® ecosystem into the governance of shared cognition, cognitive augmentation, Human-AI reasoning, trust calibration, authority allocation, synchronization, and collaborative cognition accountability.

HAICS provides the architecture space from which future Human-AI cognition governance modules may be derived.

Closing Definition

Human-AI cognition is neither human cognition nor AI cognition.

It is a distinct cognition space emerging between them.

Human-AI cognition remains valid only when contributions, authority, trust, accountability, synchronization, and shared understanding remain traceable, governable, and reality-connected throughout the cognition process.
