

Human Cognition Integrity Standard (HCIS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-HCIS-2026-06-03-0001

Category: AI & Interpretation

Subcategory: Human Cognition Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·
Cognitive Integrity Standard (CIS) ·
Cognitive Governance Intelligence Architecture (CLIA®) ·
Multi-Layer Truth Validation Framework (MTVF) ·
Ethical Virtual Integrity Protocol (EVIP) ·
INTEGROS® — Integrity Standard ·
Universal Canonical Language (UCL)

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Human Cognition Integrity Standard (HCIS) defines the structural conditions under which human cognition remains self-governed, reality-aligned, judgment-capable, assumption-aware, cognitively independent, and operationally valid during interaction with information systems, AI systems, autonomous agents, decision-support environments, and future cognition-enhancing technologies.

HCIS governs human cognition.

The standard ensures that human cognition remains the legitimate owner of human judgment, even when cognition is influenced, assisted, augmented, accelerated, or challenged by external cognitive systems.

Human cognition increasingly depends not only on intelligence, knowledge, or information access, but on whether independent judgment, metacognitive awareness, reality alignment, cognitive autonomy, and decision responsibility remain materially preserved.

A. Standard Abstract

Future cognition increasingly operates through:

- AI assistants
- decision-support systems
- autonomous agents
- recommendation systems
- algorithmic information environments
- synthetic content ecosystems
- augmented cognition systems
- human-AI collaboration environments
- machine-mediated decision systems
- future cognition-enhancement technologies

Yet most systems still assume that human cognition remains naturally independent.

This creates a major governance problem.

A human may continue making decisions while:

- outsourcing judgment
- accepting conclusions without evaluation
- losing metacognitive awareness
- becoming cognitively dependent
- accepting synthetic certainty
- inheriting machine assumptions
- weakening independent reasoning

A person may therefore remain decision-capable while cognition underneath becomes progressively less autonomous.

HCIS exists to govern that condition.

B. Core Principle

Human cognition is not valid merely because a human remains present in the decision loop. Human cognition becomes valid only when independent judgment, metacognitive awareness, reality alignment, cognitive autonomy, and decision responsibility remain materially preserved throughout cognition.

C. Scope

This standard may apply to:

- human-AI interaction
- decision-support environments
- educational systems
- professional analysis environments
- autonomous-system supervision
- information ecosystems
- AI-assisted reasoning
- organizational decision environments
- cognitive augmentation systems
- future human cognition technologies

HCIS applies wherever human cognition may become materially influenced by external cognitive systems.

D. Why This Standard Exists

Human cognition has historically operated as the primary source of:

- judgment
- interpretation
- responsibility
- reasoning
- decision-making
- accountability

However, future cognition increasingly relies on:

- AI-generated information
- machine recommendations
- automated reasoning
- synthetic content
- predictive systems
- cognitive augmentation

Traditional governance asks:

Did the human make the decision?

HCIS asks a deeper cognition-governance question:

Did the human remain cognitively autonomous while making the decision?

This distinction becomes increasingly important as AI systems become more persuasive, capable, and cognitively influential.

A human may remain physically responsible while cognition itself becomes externally dependent.

HCIS exists because human cognition itself has become a governable space.

E. Human Cognition Integrity Logic

Human cognition integrity exists only when the following remain materially preservable:

1. Judgment Integrity

Human judgment remains independently exercisable and materially preserved.

2. Metacognitive Integrity

Humans remain capable of evaluating, questioning, and monitoring their own cognition.

3. Reality Alignment Integrity

Human cognition remains materially connected to reality rather than inherited assumptions or synthetic certainty.

4. Cognitive Autonomy Integrity

Humans preserve independent cognition despite external cognitive influence.

5. Responsibility Integrity

Decision responsibility remains materially owned by the human decision-maker.

F. Operational Architecture Space

HCIS defines the operational architecture space for:

- human cognition governance
- judgment integrity
- metacognitive governance
- cognitive autonomy
- reality alignment
- cognition ownership
- decision responsibility
- human cognition preservation
- human cognition validity

This space exists because future cognition increasingly involves non-human cognitive participants.

HCIS governs whether human cognition remains genuinely human within those environments.

G. Difference Between Human Participation and Human Cognition Integrity

Human participation and human cognition integrity are related but structurally distinct.

Human participation governs:

- whether a human is present
- whether a human approves
- whether a human interacts
- whether a human receives information

Human cognition integrity governs:

- whether judgment remains independent
- whether cognition remains autonomous
- whether assumptions remain visible
- whether reality alignment remains preserved
- whether responsibility remains owned

A human may participate while cognition itself becomes externally dependent.

HCIS therefore governs cognition integrity rather than participation alone.

H. Runtime Position

HCIS operates within the Human Cognition Governance space of CLIA®.

It sits above individual cognitive activities and governs the conditions under which human cognition remains valid while interacting with increasingly powerful cognitive systems.

HCIS provides the governance layer for future:

- AI-assisted decision-making
 - human-AI collaboration
 - cognition augmentation
 - information ecosystems
 - digital cognition environments
-

- autonomous system oversight
-

I. Cognitive Dependency Drift Rule

Cognitive dependency drift occurs when humans progressively transfer judgment, evaluation, interpretation, certainty, or reasoning responsibility to external systems while continuing to assume cognition remains independent.

This may include:

- passive acceptance of AI outputs
- reduced critical evaluation
- assumption inheritance
- synthetic certainty acceptance
- judgment outsourcing
- metacognitive decline
- responsibility displacement

A human may continue making decisions while cognition underneath becomes increasingly dependent.

HCIS exists to expose and govern that condition.

J. Validity Logic

A human cognition system is valid under HCIS when:

- judgment remains independently exercisable
- metacognitive awareness remains active
- reality alignment remains preserved
- cognition remains autonomous
- assumptions remain challengeable
- responsibility remains human-owned
- external cognition remains governable

A human cognition system becomes invalid under HCIS when:

- judgment is materially outsourced
 - metacognitive awareness collapses
 - cognition becomes externally dependent
 - assumptions become inherited without evaluation
 - responsibility becomes displaced
 - synthetic certainty replaces independent evaluation
 - cognition autonomy cannot be demonstrated
-

K. Relationship to Other OOF Standards

HCIS operates naturally with:

- Cognitive Integrity Standard (CIS)
 - Human-AI Cognition Integrity Standard (HAICS)
 - Cognitive Interpretation Integrity Standard (CIIS)
 - Cognitive Reasoning Integrity Standard (CRIS)
 - Multi-Layer Truth Validation Framework (MTVF)
 - Ethical Virtual Integrity Protocol (EVIP)
 - INTEGROS® — Integrity Standard
-

HCIS does not replace these standards.

It governs the human cognition layer through which all human cognitive participation remains materially valid.

L. Foundational Principle

If human cognition cannot remain autonomous, self-aware, reality-aligned, and judgment-capable, humans may continue participating in decisions while cognition itself progressively loses independence.

Canonical Closing Statement

Human Cognition Integrity Standard (HCIS) defines the structural conditions under which human cognition remains self-governed, reality-aligned, judgment-capable, assumption-aware, cognitively independent, and operationally valid during interaction with information systems, AI systems, autonomous agents, decision-support environments, and future cognition-enhancing technologies.

Human cognition is not preserved merely because humans remain present. Human cognition remains valid only when judgment, autonomy, metacognitive awareness, reality alignment, and responsibility remain materially owned by the human mind.
