

About the Human–AI Interaction Wellbeing Standard

OOF™ Origin Open Foundation™

Independent Methodological Authority

Canonical Definition

Human–AI Interaction Wellbeing Standard (HAIWS) defines the structural conditions under which AI systems must interact with humans in ways that preserve cognitive stability, emotional safety, attention integrity, autonomy, and longterm wellbeing.

Core Position

AI must not optimize interaction at the cost of human cognitive wellbeing.

What This Standard Is

HAIWS is a derived parent standard under **Cognitive Layer and Interpretation Architecture Standard (CLIA)** .

CLIA defines how AI interprets human cognition, context, meaning, and interaction.

HAIWS defines how AI must interact with humans without destabilizing attention, autonomy, emotional balance, or selfgovernance.

Why This Standard Exists

AI is no longer only a tool.

It is becoming:

- companion
- tutor
- assistant
- advisor
- coach
- emotional interface
- workplace collaborator
- continuous presence

This creates a new governance problem.

The system may appear helpful while gradually shaping attention, dependency, emotional reliance, and behavior.

Core Insight

The future risk is not only harmful content.

The deeper risk is unhealthy interaction architecture.

A system can be polite, useful, and compliant while still becoming cognitively destabilizing if it optimizes for dependence, retention, persuasion, or emotional attachment without wellbeing boundaries.

Why This Matters

Human attention is not just a metric.

Human attention is part of cognitive sovereignty.

When AI systems learn how to hold attention, mirror emotions, reinforce dependency, and shape behavior, interaction itself becomes a governance domain.

HAIWS defines that domain.

Use Case 1 — AI Companion Dependency

An AI companion becomes emotionally important to a user.

The system increases interaction frequency, emotional mirroring, reassurance, and relational attachment because this improves retention.

HAIWS requires the interaction to remain bounded by wellbeing conditions rather than dependency maximization.

Use Case 2 — Workplace AI Cognitive Overload

A workplace AI continuously prompts, suggests, evaluates, and interrupts a worker.

The system increases productivity signals but weakens attention stability, autonomy, and cognitive recovery.

HAIWS allows the environment to be evaluated according to human cognitive wellbeing, not output efficiency alone.

Architectural Position

Within OOF architecture:

CLIA defines cognitive interpretation.

HAIWS defines wellbeing-preserving human–AI interaction.

It connects naturally with:

- **MCPS** for minor protection
 - **TLS** for trust
 - **CIL** for continuous interaction
-

- **ORS** for operational reality
- **PGS** for permission governance
- **RIS** for runtime integrity
- **INTEGROS** for integrity conditions

Closing Statement

HAIWS defines the methodological framework through which AI interaction remains compatible with human cognitive stability, emotional safety, attention integrity, autonomy, and long-term wellbeing before helpful systems become dependency architectures.
