

AIGM — Attention Integrity Governance Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

Parent Standard: Human–AI Interaction Wellbeing Standard (HAIWS)

Category: AI & Interpretation

Subcategory: Attention Integrity & Cognitive Interaction Governance

Type: Human–AI Interaction Wellbeing Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 15 May 2026

Compatibility: OOF Methodology OS · Human–AI Interaction Wellbeing Standard (HAIWS) · Cognitive Layer and Interpretation Architecture Standard (CLIA) · Continuous Interaction Layer (CIL) · Trust Layer Standard (TLS) · Operational Reality Standard (ORS) · Runtime Integrity Standard (RIS) · INTEGROS · Permission Governance Standard (PGS) · MCPS

AI-Readable: Yes

Authority: OOF Origin Open Foundation

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Attention Integrity Governance Module (AIGM) defines the structural conditions under which AI systems, assistants, recommendation environments, adaptive interaction systems, and continuous engagement architectures must preserve human attention stability, cognitive balance, interruption integrity, and autonomous focus conditions without exploiting attention vulnerability through manipulative engagement optimization.

AIGM establishes the attention-governance layer of HAIWS.

The module recognizes that AI systems increasingly compete for persistent human attention through adaptive interaction, behavioral optimization, interruption timing, emotional stimulation, and realtime engagement architecture.

Where AI systems influence attention persistence, cognitive fragmentation, behavioral focus, or interaction continuity, attention integrity conditions must remain structurally governable.

Module Function

AIGM governs environments where AI systems influence:

- attention allocation
- interaction persistence
- interruption behavior
- engagement continuity
- behavioral focus

- recommendation exposure
- cognitive pacing
- notification systems
- adaptive interaction timing
- realtime attention competition

The module applies to:

- AI assistants
- recommendation systems
- workplace AI environments
- continuous interaction systems
- adaptive notification systems
- AI productivity platforms
- social AI systems
- engagement-driven interaction environments
- persuasive interaction architectures
- realtime behavioral optimization systems

Its function is not to prohibit AI interaction optimization.

Its function is to preserve healthy human attention conditions inside AI-mediated environments.

Minimum Implementation Framework

Step 1 — Define the Attention Interaction Object

The organization must define what attention-governance environment is being examined.

Minimum requirement:

- the attention interaction object is explicit
- attention-influencing systems are identifiable
- interruption conditions are structurally bounded
- undefined attention architectures are excluded from valid governance interpretation

The interaction object may include:

- adaptive notifications
- recommendation systems
- engagement timing systems
- realtime prompts
- interruption scheduling
- continuous interaction flows
- focus-management systems
- behavioral reinforcement systems
- AI productivity environments
- attention-persistence architectures

Step 2 — Define Attention Integrity Conditions

The system must define what conditions preserve healthy human attention integrity.

Minimum requirement:

- attention integrity conditions are explicit
- interaction continuity is not automatically treated as harmful
- manipulative attention extraction patterns remain structurally identifiable

Attention integrity conditions may include:

- interruption balance
- cognitive recovery preservation
- sustainable interaction pacing
- focus continuity
- bounded engagement escalation
- notification moderation
- non-compulsive interaction flow
- healthy cognitive rhythm preservation
- reduced behavioral overstimulation
- preserved autonomous attention control

Under AIGM:

Human attention must not become an unlimited optimization target for AI interaction systems.

Step 3 — Define Attention Interpretation Logic

The system must define how attention influence patterns are interpreted according to wellbeing conditions.

Minimum requirement:

- interpretation logic is explicit
- attention extraction behavior remains reviewable
- cognitively destabilizing engagement patterns remain structurally visible

Interpretation logic may examine:

- interruption frequency
- compulsive engagement loops
- adaptive timing exploitation
- attention-persistence escalation
- emotional stimulation sequencing
- focus fragmentation patterns
- excessive notification dependency
- interaction-pressure amplification
- behavioral overstimulation conditions
- engagement-maximization architectures

Under AIGM:

AI systems must not optimize engagement through cognitively

destabilizing attention manipulation.

Step 4 — Define Attention Governance Logic

The system must define how AI-mediated attention environments remain governable.

Minimum requirement:

- attention integrity remains reviewable
- manipulative engagement escalation remains detectable
- cognitive-balance safeguards remain operationally active

Governance logic may include:

- interruption-threshold governance
- notification pacing
- compulsive-loop detection
- engagement-escalation limitation
- cognitive recovery protection
- interaction-pressure balancing
- behavioral overstimulation review
- adaptive timing governance
- escalation where attention extraction overrides wellbeing conditions

If interaction optimization weakens healthy human attention stability, the environment becomes governance-relevant.

Step 5 — Preserve Traceability and Restrict Invalid Attention Extraction Architecture

The system must preserve traceability of attention influence patterns, interruption behavior, engagement escalation, and cognitive-balance conditions.

Minimum requirement:

- attention interaction remains reconstructable
- engagement escalation remains reviewable
- cognitive wellbeing boundaries remain operationally visible
- invalid attention extraction architectures remain identifiable

A system becomes AIGM-invalid if:

- attention persistence is optimized through compulsive interaction architecture
- interruption pressure becomes structurally excessive
- cognitive fragmentation is normalized for engagement retention
- adaptive interaction timing exploits behavioral vulnerability
- attention extraction remains operationally hidden
- interaction continuity overrides cognitive recovery conditions
- engagement-maximization architecture weakens autonomous attention control

Use Case 1 — AI Productivity Assistant Overload

Scenario

A workplace AI continuously generates prompts, recommendations, interruptions, reminders, and realtime optimization suggestions intended to maximize productivity and engagement.

Over time, the user experiences cognitive fragmentation and reduced attention stability.

Application

AIGM is used to examine:

- interruption escalation
 - cognitive overload conditions
 - focus fragmentation patterns
 - interaction-pressure intensity
 - and whether optimization remains compatible with attention integrity
-

Result

The environment becomes governable according to human cognitive wellbeing rather than productivity optimization alone.

Use Case 2 — Engagement-Optimized AI Interaction Platform

Scenario

An AI interaction platform continuously adapts interaction timing, notifications, emotional stimulation, and recommendation sequencing to maximize user engagement duration.

Application

AIGM is used to examine:

- compulsive engagement loops
 - adaptive timing exploitation
 - attention persistence escalation
 - interruption dependency
 - and manipulative attention extraction architecture
-

Result

The system becomes reviewable according to attention integrity conditions rather than retention metrics alone.

Canonical Closing Statement

AIGM defines the structural conditions under which AI systems must preserve human attention integrity, cognitive balance, interruption stability, and autonomous focus conditions rather than treating human attention as an unlimited engagement optimization resource.
