

Honey Dissolvable Wrapper Module (HDWM)

OriginID: OOF-OID-PD-HIS-HDWM-2026-04-04-0001

Category: Product & Design

Subcategory: Honey Integrity

Module: Honey Dissolvable Wrapper Module

Type: Application and Interaction Module

Standard: Honey Integrity Standard (HIS)

Version: 1.0

Status: Canonical Module

Effective Date: 4 April 2026

Authority: OOF™ Origin Open Foundation™

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL™)

A. Module Abstract

The **Honey Dissolvable Wrapper Module (HDWM)** defines the conditions under which honey portions may be enclosed within a natural, dissolvable material to enable clean handling, precise dosing, and improved user interaction without compromising honey integrity.

The objective is to:

- eliminate direct contact with honey
- prevent sticking and contamination
- enable controlled dosing
- preserve 100% honey composition
- introduce a natural interaction layer

This module does not modify honey.

It defines **how honey may be handled without degradation.**

B. Canonical Definition

A **Honey Dissolvable Wrapper** is a natural, consumable or biodegradable material that:

- encloses a honey portion
- prevents direct contact during handling
- dissolves or disperses during use
- does not alter the composition of honey

The wrapper is not part of the honey.

It is an **interaction interface.**

C. Structural Base

This module is based on:

- Non-Contamination Principle
- Natural Interface Requirement
- Zero-Residue Condition
- Integrity Preservation Principle

Honey must remain untouched.

Interaction must be controlled.

D. Material Requirements

Wrapper materials MUST be:

- of natural origin
 - safe for human consumption or contact
 - free from synthetic polymers
 - free from chemical additives affecting honey
-

Allowed Material Categories

- plant-based films (e.g. starch-based)
 - edible paper (e.g. rice-based)
 - natural soluble films
 - biodegradable thin layers
-

Not Allowed

- plastic films
 - synthetic coatings
 - non-dissolvable materials
 - chemically reactive surfaces
-

E. Functional Requirements

1. Non-Stick Function

The wrapper MUST:

- prevent honey from direct contact with hands
 - reduce surface adhesion during handling
-

2. Dissolution Requirement

The wrapper MUST:

- dissolve in hot liquid (e.g. tea, coffee)
 - or safely disperse without residue
-

3. Neutrality Requirement

The wrapper MUST NOT:

- alter taste significantly
 - affect aroma
-

- introduce foreign sensory impact
-

4. Structural Integrity

The wrapper MUST:

- maintain form during storage
 - protect the honey portion
 - allow easy handling
-

F. Usage Conditions

The wrapper MUST function in:

- beverage application (tea, coffee)
 - direct consumption (optional)
 - controlled dosing environments
-

G. Functional Use Case — Clean Beverage Integration

Scenario

User wants to sweeten tea using honey without mess.

Application

- honey portion is wrapped in dissolvable film
 - user places it directly into hot liquid
 - wrapper dissolves
 - honey integrates naturally
-

Result

- no sticky handling
 - precise dosing
 - improved user experience
 - preserved honey integrity
-

H. Functional Use Case — Hygienic Handling

Scenario

Honey is used in public or shared environments (cafés, travel).

Application

- individually wrapped honey portions
 - no direct hand contact
 - clean and controlled use
-

Result

- improved hygiene
 - reduced contamination risk
 - consistent product experience
-

I. Environmental Condition

Wrapper systems SHOULD:

- be biodegradable
 - minimize waste
 - enable material separation where applicable
-

J. Threshold Logic

Product condition is:

VALID → wrapper is natural, dissolvable, non-intrusive

INVALID → wrapper introduces contamination or synthetic interference

No partial compliance is permitted.

K. Structural Principle

The interface may change.

The substance must not.

Canonical Closing Statement

Honey does not need to be touched to be used.

Honey Dissolvable Wrapper Module defines a new interaction layer where handling becomes clean, controlled, and natural — without altering the substance itself.

When the interface is solved, the product remains pure.
