

About the Infused Water Standard (IWS™)

Canonical Definition

Infused Water Standard (IWS™) defines the conditions under which water may be naturally enriched through infusion while remaining structurally identifiable as water and suitable for continuous hydration.

Infused water does not become a supplement, extract, or flavored beverage.

It remains water, enriched only through controlled natural release from valid source material.

What This Standard Is

IWS™ is a category-defining hydration integrity standard.

It establishes the structural boundary between:

- water
- naturally infused water
- flavored beverage systems
- supplement-like liquid products

This standard defines when natural enrichment remains compatible with the identity of water.

It ensures that infused water remains:

- hydration-oriented
 - naturally enriched
 - structurally controlled
 - compositionally trustworthy
-

What This Standard Is Not

IWS™ is not:

- a recipe
- a supplement framework
- a tea standard
- an extract standard
- a flavored beverage definition

It does not define transformation into a new beverage system.

It defines when water remains water under natural infusion conditions.

Why This Standard Exists

The category of infused water is widely used, but weakly defined.

In practice, products may be presented as infused water while actually functioning as:

- flavored beverages
- additive-based hydration products
- concentrated herbal systems
- light supplement liquids

Without structural definition, the category becomes vague and easily distorted.

IWS™ exists to preserve a clear hydration boundary.

It defines when natural infusion enriches water without replacing its identity.

Core Problem

Water is often enriched, flavored, or modified without a stable distinction between:

- true contact-based infusion
- direct addition
- concentrated plant systems
- hydration products with transformed identity

This creates confusion in:

- product positioning
- consumer understanding
- category trust
- market comparability

The problem is not enrichment itself.

The problem is the absence of a structural boundary that protects water from category drift.

What It Solves

IWS™ solves this by defining when infusion remains valid and when it no longer qualifies as infused water.

It requires that:

- water remains the dominant medium
- enrichment occurs through contact-based release
- no additive logic replaces natural infusion
- the final output remains suitable for repeated hydration use

This creates a stable category that can be understood, compared, and extended without confusion.

Core Insight

Infusion is not addition.
It is release through contact.

That difference is small at the level of preparation, but very large at the level of category identity.

A water system remains valid only when enrichment does not redefine the medium.

**Water may be enriched.
It must not be redefined.**

Why It Matters

Hydration is one of the most universal and repeated product functions in everyday life.

That makes infused water important.

As consumers increasingly seek:

- natural hydration
- lower-intervention products
- plant-based or mineral-based routines
- alternatives to synthetic flavoring

the distinction between authentic infused water and imitation becomes more valuable. IWS™ protects the future of the category by ensuring that:

- hydration remains the primary function
- enrichment remains structurally natural
- water identity remains preserved

This is a small structural distinction with a large long-term product effect.

Structural Limitation

IWS™ excludes:

- concentrated herbal extracts
- medicinal decoctions
- additive-based systems
- flavor-dominant beverages

These may be valid products in other categories.

They do not belong to infused water when water identity is no longer preserved.

Use Case 1 — Daily Herbal Hydration

Scenario

An individual integrates plant-based infusion into daily hydration.

Application

- low-intensity herbal infusion
- no synthetic additives
- repeated daily use within hydration context

Result

- natural hydration enhancement
 - cleaner product logic
 - reduced dependence on artificial hydration products or supplement-style liquids
-

Use Case 2 — Clean Hydration Product

Scenario

A brand develops plant-based hydration products positioned around natural infusion rather than artificial flavoring.

Application

- infusion replaces synthetic flavor logic
- sourcing remains transparent
- process remains compatible with IWS™ structural conditions

Result

- scalable clean hydration product
 - stronger category credibility
 - clearer distinction from flavored beverages and additive-based products
-

Future Module Logic

IWS™ may later support two primary module directions:

- **Herbal Infused Water**
- **Mineral Infused Water**

These modules can extend the standard without changing the core boundary of the category. The parent standard remains stable.

Modules may specify source type.

Closing Statement

Infused water is not defined by taste.

It is defined by structural restraint.

Water remains water.

Everything else must respect that boundary.
