

Mineral Infused Water Module (MIW™)

Parent Standard: Infused Water Standard (IWS™)

Category: Product & Design

Subcategory: Infused Water

Type: Product Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 25 April 2026

Authority: OOF®

Protection: MIP® — Methodological Intellectual Property

Canonical Language: English (UCL™)

Compatibility: IWS™ · Origin Eco™ · Product Integrity
Standards · Natural Systems

Canonical Definition

Mineral Infused Water Module (MIW™) defines the product-specific conditions under which water may be naturally enriched through contact with valid mineral source material while remaining structurally identifiable as water and suitable for continuous hydration.

Mineral infused water is valid only when mineral enrichment occurs through natural contact-based release and does not transform water into a fortified, additive-based, or chemically modified product.

Module Position

This module operates under the **Infused Water Standard (IWS™)**.

IWS™ defines the parent hydration boundary.

MIW™ defines the mineral application of that boundary.

The module specifies when mineral source material may enrich water without replacing its identity as water.

Base

Water remains the primary medium.

Mineral source material enables natural release through contact.

The output remains water.

The process does not create a supplement or chemically fortified liquid.

It preserves hydration while allowing controlled mineral enrichment.

Core Principle

Mineral contact may enrich water.
It must not redefine it.

A valid mineral infused water system depends on passive release,
structural restraint, and preservation of hydration identity.

Product Conditions

For mineral infused water to remain valid within this module,
it must:

- use water as the dominant medium
- use natural mineral source material suitable for water contact
- rely on passive mineral release through contact
- avoid direct mineral addition or artificial fortification
- remain suitable for repeated hydration use

Valid mineral source materials may include natural mineral-bearing
materials suitable for controlled water contact under safe
conditions.

All source materials must remain:

- safe
 - clean
 - suitable for human use
 - free from contamination and unsafe release behavior
-

Integrity Principle

Mineral infused water remains valid only when:

- enrichment occurs through real contact-based release
- no direct additive logic replaces mineral infusion
- no forced mineralization or chemical alteration is used
- output remains structurally water

If mineral loading redefines the function or identity of water,
the product exits this module.

Minimum Implementation Framework (MIF)

Step 1 — Water Base

Use clean water suitable for repeated hydration.

Minimum requirement:

- water must remain the dominant medium
-

- no additive-based mineral fortification may replace infusion
-

Step 2 — Mineral Source Selection

Use mineral source material suitable for water contact and safe human use.

Minimum requirement:

- source material must be naturally suitable
 - source material must be clean and stable
 - no unsafe contamination or uncontrolled release may be present
-

Step 3 — Contact-Based Infusion

Apply mineral enrichment through passive contact between water and mineral source material.

Minimum requirement:

- release must occur through contact
 - no direct addition of mineral substances may simulate infusion
 - no artificial acceleration may replace natural release logic
-

Step 4 — Intensity Control

Control time, exposure, and contact conditions.

Minimum requirement:

- enrichment must remain within hydration identity
 - output must not become a supplement-like or chemically dominant liquid
 - mineral presence must not override structural water identity
-

Step 5 — Output Validation

Confirm final state.

Minimum requirement:

- water remains dominant
 - output is suitable for continuous hydration
 - product is not structurally classified as fortified water, supplement liquid, or chemically modified drink
-

Output Definition

Mineral Infused Water (MIW™ compliant) is water that:

- contains naturally released mineral compounds through contact
 - remains structurally water
 - supports hydration through controlled natural mineral enrichment
 - is suitable for repeated consumption within hydration context
-

Structural Limitation

This module excludes:

- direct mineral fortification
- forced mineralization
- additive-based mineral drinks
- supplement-style hydration products
- products whose mineral intensity exceeds water identity

These may be valid products in other categories.

They are not valid within Mineral Infused Water under MIW™.

Use Case 1 — Daily Mineral Hydration

Scenario

An individual uses naturally mineral-infused water as part of regular hydration.

Application

- water is exposed to valid mineral source material under controlled conditions
- no direct additives are used
- the final product remains suitable for repeated daily hydration

Result

- hydration is naturally enriched
 - water remains structurally simple and clean
 - mineral presence is achieved without conversion into supplement logic
-

Use Case 2 — Natural Mineral Hydration Product

Scenario

A brand develops a hydration product based on natural mineral contact rather than additive-based fortification.

Application

- mineral release occurs through contact-based process
 - source material remains transparent
 - output remains compatible with MIW™ and IWS™ conditions
-

Result

- clean hydration product with natural mineral positioning
 - clearer distinction from fortified drinks
 - stronger category credibility through structural restraint
-

One-Line Definition

Mineral Infused Water is water naturally enriched through controlled mineral contact while remaining structurally valid for continuous hydration.

Canonical Closing Statement

**Minerals may enrich water.
They must not redefine it.**
