

About Integrity Restoration Standard - (IRRS)

Understanding Governed Integrity Restoration

Responding to an integrity breach does not automatically restore integrity.

Once a breach has been contained, governance must ensure that integrity has been objectively re-established before normal operations resume. Restoration requires more than recovery—it requires validated evidence, accountable governance, and confirmation that approved integrity conditions have been fully restored.

Integrity Restoration Standard transforms operational recovery into a governed and auditable restoration process.

What Is Integrity Restoration Standard?

Integrity Restoration Standard (IRRS) defines the governance principles required to restore integrity following a verified integrity breach and completed response activities. It ensures that restoration is performed through a standardized governance methodology supported by objective validation, documented evidence, and accountable decision-making.

Canonical Definition

Integrity Restoration Standard (IRRS) defines the governance conditions required to restore integrity following a verified integrity breach and completed response activities. It establishes the restoration principles, recovery procedures, validation requirements, accountability mechanisms, evidence requirements, and governance controls required to return a governed entity to an approved state of integrity while ensuring that restoration is objective, verifiable, and fully auditable throughout the complete lifecycle of the governed entity.

Why IRRS Exists

Containing an integrity breach is not the same as restoring integrity.

Organizations require a standardized governance framework that defines how integrity is re-established, who validates the restoration, what evidence is required, when restoration is considered complete, and how restored integrity is documented for future governance and audit purposes.

IRRS provides this canonical governance framework.

What IRRS Governs

IRRS governs the complete integrity restoration lifecycle, including:

- restoration planning
 - restoration execution
-

- integrity recovery
- restoration validation
- restoration evidence
- restoration documentation
- restoration governance.

Use Case 1 — Autonomous AI GovernanceScenario

A verified integrity breach has been contained, and autonomous AI services have resumed limited operation. Before full production is restored, the organization must demonstrate that governance conditions, operational integrity, and system trustworthiness have been objectively re-established. Application

IRRS governs the restoration process by coordinating recovery activities, validating restored integrity, documenting restoration evidence, and confirming that all approved integrity conditions have been satisfied before normal operation resumes. Result

Integrity is restored through a governed, evidence-based, and fully auditable process, allowing autonomous operations to resume with documented confidence and accountability. Use Case 2 — Critical Infrastructure RecoveryScenario

A national energy operator successfully contains an integrity breach affecting operational control systems. Critical services must now be restored without introducing additional operational risk. Application

IRRS governs the restoration methodology, validates recovery activities, confirms that operational integrity has been re-established, and documents objective evidence supporting the return to normal operations. Result

Critical infrastructure returns to service through a controlled restoration process supported by governance, accountability, operational resilience, and complete auditability.

Architectural Position

Within INTEGROS®, IRRS represents the ninth governed space.

It follows Integrity Response Standard (IRS) and provides the governance transition from controlled response to Integrity Assurance Standard (IAS), ensuring that integrity has been objectively restored before continuous assurance begins.

Governance Flow

Definition → Structure → Conditions → Measurement → State → Deviation → Breach
→ Response → Restoration → Assurance

Canonical Closing Statement

Integrity Restoration Standard provides the canonical governance framework for restoring integrity following verified breaches and governed responses through validated, accountable, evidence-based, and auditable restoration activities. It ensures that integrity is objectively re-established before continuous

assurance begins, preserving governance continuity throughout the complete lifecycle of every governed entity.
