

About Integrity State Standard - (ISS)

Understanding the Current Condition of Integrity

Objective measurements alone do not describe the actual condition of integrity. Governance requires a standardized representation of integrity that communicates whether a governed entity currently operates with preserved, degraded, compromised, or restored integrity.

What Is Integrity State Standard?

Integrity State Standard (ISS) is the fifth Parent Standard of INTEGROS® — Integrity Governance Architecture. It establishes the canonical governance conditions required to determine, classify, manage, and communicate the current operational state of integrity throughout the complete lifecycle of a governed entity.

Canonical Definition

Integrity State Standard (ISS) defines the governance conditions required to determine, classify, and maintain the current operational state of integrity by establishing standardized integrity states, state transition rules, and governance criteria throughout the complete lifecycle of a governed entity.

Why ISS Exists

After integrity has been defined, structured, protected by governance conditions, and objectively measured, governance still requires a clear answer to one essential question:

What is the current integrity condition?

Building upon the objective measurements established by IMS, ISS transforms integrity measurements into standardized operational integrity states.

This enables organizations, autonomous systems, regulators, auditors, and governance frameworks to communicate integrity consistently using a common operational language.

What ISS Governs

ISS governs the classification and lifecycle management of integrity states, including: integrity state determination, integrity state classification, operational integrity status, state transition governance, integrity state consistency, lifecycle state management, integrity state reporting.

This governed space ensures that integrity is represented consistently across all operational, organizational, digital, and autonomous environments.

Architectural Position

Within INTEGROS® — Integrity Governance Architecture, ISS is the fifth Parent Standard in the governance flow:

Definition → Structure → Conditions → Measurement → State → Deviation → Breach
→ Response → Restoration → Assurance

ISS establishes the canonical operational representation of integrity before deviations, breaches, governance responses, restoration activities, and long-term assurance are performed.

Canonical Closing Statement

Integrity State Standard establishes the canonical governance framework for determining, classifying, and managing the current operational condition of integrity. By governing integrity states, state transitions, and classification criteria, ISS provides the standardized representation upon which integrity deviation detection, breach identification, governance response, restoration, and long-term assurance are built throughout the complete lifecycle of every governed entity.
