

Dependency Validation Module (DVM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-INTEGROS-ICS-DVM-2026-07-17-0003

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: INTEGROS® — Integrity Governance Architecture

Parent Standard: Integrity Condition Standard (ICS)

Operational Layer: Meta-Integrity Governance Layer

Category: Governance & Enforcement

Subcategory: Integrity Governance

Type: Parent Standard Module

Governed Space: Dependency Validation

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · ART™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Dependency Validation

Canonical Definition

Dependency Validation Module (DVM) defines the governance conditions required to validate that every dependency supporting integrity remains continuously available, legitimate, consistent, and operationally valid throughout the complete lifecycle of a governed entity.

Operational Role

DVM governs the validation of integrity dependencies. It ensures that every internal and external dependency required to preserve integrity is continuously verified before integrity is considered valid.

Minimum Implementation Framework

1. Define Integrity Dependencies

Identify every dependency required to preserve integrity, including

structural, operational, organizational, technical, governance, regulatory, and external dependencies that influence the governed entity.

2. Define Dependency Validation Requirements

Establish the governance requirements used to validate dependency availability, legitimacy, consistency, continuity, authorization, and operational readiness.

3. Define Dependency Failure Logic

Identify the conditions under which a dependency becomes unavailable, invalid, inconsistent, unauthorized, obsolete, interrupted, or otherwise incapable of supporting integrity.

4. Define Governance Response

Define governance actions for validating, replacing, restoring, mitigating, approving, or removing dependencies whenever dependency validation identifies a condition that threatens integrity.

5. Preserve Dependency Validation Records

Preserve dependency definitions, validation results, governance approvals, dependency changes, supporting evidence, and validation history throughout the complete lifecycle.

Example Use Cases

Use Case 1 — Cloud Governance Platform

Scenario

A cloud governance platform depends on identity services, encryption infrastructure, audit services, policy engines, and external regulatory databases to preserve operational integrity.

Application

DVM continuously validates that every dependency remains available, authorized, and operational before integrity is considered preserved.

Result

The platform maintains trustworthy integrity by ensuring that every critical dependency remains continuously validated and governable.

Use Case 2 — Autonomous Manufacturing System

Scenario

An autonomous manufacturing system depends on robotic controllers, sensor networks, quality inspection services, production scheduling, and safety systems.

Application

DVM validates every operational dependency before autonomous production continues, ensuring that no failed dependency silently compromises system integrity.

Result

Manufacturing operations remain structurally reliable, operationally safe, and integrity-preserving through continuous dependency validation.

Canonical Closing Statement

Integrity depends upon trusted dependencies. Dependency Validation Module ensures that every dependency supporting integrity remains continuously validated, legitimate, and governable, preserving the operational validity of every governed entity throughout its complete lifecycle.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.
