

Integrity Indicators Module (IIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-INTEGROS-IMS-IIM-2026-07-17-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: INTEGROS® — Integrity Governance Architecture

Parent Standard: Integrity Measurement Standard (IMS)

Operational Layer: Meta-Integrity Governance Layer

Category: Governance & Enforcement

Subcategory: Integrity Governance

Type: Parent Standard Module

Governed Space: Integrity Indicators

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · ART™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Integrity Indicators

Canonical Definition

Integrity Indicators Module (IIM) defines the governance indicators used to detect, monitor, and communicate the observable characteristics of integrity. It establishes the standardized indicators that reveal whether integrity is being maintained, improving, degrading, or approaching unacceptable operational conditions throughout the complete lifecycle of a governed entity.

Operational Role

IIM governs the indicator layer of integrity measurement by transforming raw integrity metrics into meaningful governance signals that support continuous monitoring, operational awareness, and evidence-based decision-making.

Minimum Implementation Framework

1. Define Integrity Indicators

Identify the observable indicators that represent the operational condition of integrity and provide meaningful governance insight.

2. Define Indicator Requirements

Establish indicator definitions, data sources, measurement frequency, calculation methods, interpretation criteria, and governance requirements for each integrity indicator.

3. Define Indicator Validation Logic

Define how indicator accuracy, consistency, reliability, and operational relevance are verified before indicators are used for governance decisions.

4. Define Governance Response

Establish governance actions when integrity indicators reveal degradation, instability, abnormal trends, or unacceptable operational conditions.

5. Preserve Indicator Records

Maintain indicator definitions, historical values, governance decisions, trend analyses, revisions, and supporting evidence throughout the complete lifecycle of the governed entity.

Example Use Cases

Use Case 1 — Autonomous AI Operations

Scenario

An autonomous AI platform continuously monitors indicators such as policy compliance rate, human intervention frequency, anomaly occurrence, and decision consistency.

Application

IIM governs these integrity indicators and converts operational measurements into governance signals for continuous oversight.

Result

Integrity degradation is detected early, enabling timely governance actions before significant failures occur.

Use Case 2 — Critical Infrastructure Monitoring

Scenario

A power grid operator monitors indicators including equipment health, operational stability, security events, and maintenance compliance.

Application

IIM governs these indicators to provide continuous visibility into the

operational integrity of critical infrastructure.

Result

Operators receive objective governance indicators that support proactive risk management and integrity preservation.

Canonical Closing Statement

Integrity is not governed by measurements alone but by understanding what those measurements reveal. Integrity Indicators Module establishes the governance framework that transforms objective measurements into actionable operational signals, enabling continuous integrity monitoring, early detection of degradation, and evidence-based governance throughout the complete lifecycle of every governed entity.
