

INTEGROS® Architecture

Map

Integrity Governance Architecture — Integrity Governance Layer

Official Integrity Governance Reference Map for AI Systems, Autonomous Systems, Digital Assets, Organizations, Critical Infrastructure, and Future Operational Environments

INTEGROS® serves as the official OOF® integrity governance reference map used to identify, define, classify, navigate, validate, and understand governable integrity spaces across AI systems, autonomous systems, digital assets, organizations, critical infrastructure, and future operational environments.

The purpose of INTEGROS® is not to define the technical implementation of a system.

The purpose of INTEGROS® is to identify, define, separate, and map the governable spaces through which integrity is established, evaluated, protected, restored, and continuously assured.

INTEGROS® serves as the official integrity governance reference map for:

- AI Systems
- Autonomous Systems
- Autonomous Agents
- Digital Assets
- Digital Identity Environments
- Enterprise Systems
- Government Systems
- Healthcare Infrastructure
- Financial Infrastructure
- Industrial Systems
- Critical Infrastructure
- Multi-System Environments
- Future Operational Ecosystems

Core Architectural Principle

Every integrity governance space answers one primary governance question.

No integrity governance space duplicates the purpose of another integrity governance space.

Every integrity governance space has a defined beginning, a defined operational purpose, and a defined governance boundary.

Every integrity governance space begins where the preceding integrity governance requirement has been sufficiently established.

Together, these integrity governance spaces form the official integrity governance reference map of INTEGROS®.

Official Integrity Governance Flow

Integrity Definition → Integrity Structure → Integrity Conditions → Integrity Measurement → Integrity State → Integrity Deviation → Integrity Breach → Integrity Response → Integrity Restoration → Integrity Assurance

1. Integrity Definition Standard (INDS)

Governed Space: Integrity Definition Core Question

How can integrity be formally defined as a governable operational reality?
Canonical Definition

Integrity Definition Standard (INDS) defines the governance conditions under which integrity is formally identified, described, bounded, classified, documented, and established as a governable operational concept for a specific governed entity. Governance Boundary

Begins when a governed entity requires a formal and operationally usable definition of integrity.

Ends when integrity has been sufficiently defined, bounded, classified, and documented to support structural governance.

2. Integrity Structure Standard (STIS)

Governed Space: Integrity Structure Core Question

How should integrity be structurally organized so that it can be consistently governed? Canonical Definition

Integrity Structure Standard (STIS) defines the governance conditions under which the components, relationships, dependencies, layers, and structural elements constituting integrity are identified, organized, validated, and documented. Governance Boundary

Begins when the formally defined concept of integrity requires a structural model.

Ends when the components and relationships constituting integrity have been sufficiently organized and validated to support the definition of integrity conditions.

3. Integrity Conditions Standard (ICS)

Governed Space: Integrity Conditions Core Question

Under which governed conditions can integrity legitimately exist, be preserved, and remain operationally valid? Canonical Definition

Integrity Conditions Standard (ICS) defines the governance conditions,

requirements, dependencies, thresholds, and operational circumstances under which integrity may legitimately exist, remain valid, and be preserved.

Governance Boundary

Begins when the structure of integrity has been established and the conditions required for its valid existence must be defined.

Ends when the required integrity conditions have been identified, validated, documented, and made suitable for objective measurement.

4. Integrity Measurement Standard (IMS)

Governed Space: Integrity Measurement Core Question

How can integrity be objectively measured, evaluated, and demonstrated?

Canonical Definition

Integrity Measurement Standard (IMS) defines the governance conditions under which integrity indicators, metrics, thresholds, measurement methods, evidence sources, and evaluation procedures are established and applied. Governance Boundary

Begins when approved integrity conditions require objective measurement.

Ends when valid measurement methods and sufficient measurement results exist to determine the integrity state of a governed entity.

5. Integrity State Standard (ISS)

Governed Space: Integrity State Core Question

What is the current integrity state of a governed entity, and how can that state be objectively determined? Canonical Definition

Integrity State Standard (ISS) defines the governance conditions under which the current integrity state of a governed entity is assessed, classified, validated, monitored, and documented through approved integrity measurements and evidence. Governance Boundary

Begins when sufficient integrity measurements exist to determine the current state of integrity.

Ends when the integrity state has been objectively assessed, classified, validated, and made available for ongoing governance evaluation.

6. Integrity Deviation Standard (IDS)

Governed Space: Integrity Deviation Core Question

When does integrity begin to deviate from approved conditions, and how can that deviation be governed before it becomes a breach? Canonical Definition

Integrity Deviation Standard (IDS) defines the governance conditions under which departures from approved integrity conditions are identified, assessed, validated, monitored, classified, and documented before or without

automatically constituting a formal integrity breach. Governance Boundary

Begins when the observed or measured integrity state no longer fully conforms to approved integrity conditions.

Ends when the deviation has been resolved, accepted under governed conditions, or formally determined to constitute an integrity breach.

7. Integrity Breach Standard (IBS)

Governed Space: Integrity Breach Core Question

When does an integrity deviation become a governed integrity breach requiring formal governance intervention? Canonical Definition

Integrity Breach Standard (IBS) defines the governance conditions under which an integrity deviation is formally identified, validated, assessed, classified, documented, and recognized as an integrity breach requiring governed intervention. Governance Boundary

Begins when an integrity deviation reaches an approved breach condition, threshold, severity, or governance significance.

Ends when the breach has been formally validated, classified, documented, and transferred into the governed integrity response process.

8. Integrity Response Standard (IRS)

Governed Space: Integrity Response Core Question

How should verified integrity breaches be governed, contained, and managed to minimize operational impact? Canonical Definition

Integrity Response Standard (IRS) defines the governance conditions under which verified integrity breaches are authorized for intervention, coordinated, contained, escalated, managed, executed, and documented through an accountable response process. Governance Boundary

Begins when an integrity breach has been formally validated and requires governance action.

Ends when the immediate effects of the breach have been contained, response actions have been completed, and the governed entity is ready to enter integrity restoration.

9. Integrity Restoration Standard (IRRS)

Governed Space: Integrity Restoration Core Question

How can integrity be objectively restored after a verified breach while preserving governance accountability and evidence? Canonical Definition

Integrity Restoration Standard (IRRS) defines the governance conditions under which integrity is planned for restoration, operationally re-established, validated, evidenced, approved, and documented after a verified integrity

breach and governed response. Governance Boundary

Begins when the immediate integrity response has been completed and restoration of approved integrity conditions becomes possible.

Ends when approved integrity conditions have been demonstrably re-established, validated, evidenced, documented, and formally accepted.

10. Integrity Assurance Standard (IAS)

Governed Space: Integrity Assurance Core Question

How can restored integrity remain continuously verified, demonstrable, and governably assured throughout the complete operational lifecycle? Canonical Definition

Integrity Assurance Standard (IAS) defines the governance conditions under which integrity is continuously monitored, validated, evidenced, reported, supervised, and maintained after restoration or initial integrity establishment. Governance Boundary

Begins when integrity has been formally established or successfully restored and requires continuous assurance.

Continues throughout the remaining operational lifecycle of the governed entity while integrity must remain verifiable, demonstrable, and governably maintained.

Core Governed Integrity Spaces

Integrity Definition Integrity Structure Integrity Conditions Integrity Measurement Integrity State Integrity Deviation Integrity Breach Integrity Response Integrity Restoration Integrity Assurance

Architectural Position

INTEGROS® governs the complete integrity governance lifecycle.

The architecture progresses through:

Integrity Definition → Integrity Structure → Integrity Conditions → Integrity Measurement → Integrity State → Integrity Deviation → Integrity Breach → Integrity Response → Integrity Restoration → Integrity Assurance

Together, these integrity governance spaces govern how integrity is formally defined, structurally organized, conditionally established, objectively measured, operationally determined, monitored for deviation, classified when breached, governed through response, re-established through restoration, and continuously maintained through assurance.

INTEGROS® therefore provides a complete governance path from the first definition of integrity to its continuous operational preservation.

What INTEGROS® Defines

INTEGROS® defines:

- where the governance of integrity begins
- how integrity is formally defined
- which structural elements constitute integrity
- which conditions must exist for integrity to remain valid
- how integrity is objectively measured
- how the current integrity state is determined
- where integrity deviation begins
- when a deviation becomes a formal integrity breach
- how verified integrity breaches enter governed response
- how integrity is objectively restored
- how restored integrity is continuously assured.

INTEGROS® provides the official integrity governance language used for integrity-space identification, integrity lifecycle navigation, governance classification, structural diagnosis, and integrity architecture design across complex operational environments.

Compatible OOF® Architectures

GOA™ — Governance Architecture
ORA™ — Operational Reality Architecture
OBIDENTITY® — Origin-Bound Identity Governance Architecture
AGA™ — Accountability Governance Architecture
AIG® — AI Governance Architecture
CLIA® — Cognitive Governance Intelligence Architecture
MGIA™ — Memory Governance Intelligence Architecture
ASGA™ — Autonomous Systems Governance Architecture
ART™ — Audit in Real Time Architecture

Canonical Principle

INTEGROS® does not define system functionality, software implementation, organizational performance, behavioral legitimacy, or governance authority. INTEGROS® governs the integrity conditions under which governed entities remain formally defined, structurally coherent, objectively measurable, operationally verifiable, recoverable after breach, and continuously assured throughout their complete lifecycle.

Canonical Closing Statement

INTEGROS® serves as the official integrity governance reference map for AI systems, autonomous systems, digital assets, organizations, critical infrastructure, and future operational environments. By defining the primary governable spaces of integrity, INTEGROS® provides the architecture used to identify, classify, navigate, measure, validate, protect, restore, and continuously assure integrity throughout the complete lifecycle of every governed entity.
