

INTEGROS®

Integrity Governance Architecture (INTEGROS®) — Integrity Governance Layer

Official Integrity Governance Architecture for AI Systems, Autonomous Systems, Digital Assets, Organizations, Critical Infrastructure, and Future Operational Environments

INTEGROS® serves as the official OOF® integrity governance architecture used for integrity governance design, integrity space identification, integrity validation, integrity assessment, integrity restoration, integrity assurance, and integrity governance navigation across AI systems, autonomous systems, organizations, digital assets, critical infrastructure, and future operational environments.

Integrity Governance Architecture (INTEGROS®) does not define integrity itself. INTEGROS® defines the governance architecture required to ensure that integrity remains structurally defined, measurable, governable, verifiable, restorable, and continuously assured throughout the complete integrity lifecycle.

INTEGROS® consists of 10 Core Parent Standards forming the primary integrity governance backbone within the OOF® ecosystem.

Additional compatible standards, bridge standards, and specialized integrity governance standards may extend the architecture when new integrity governance spaces are identified. However, the standards listed below form the official core integrity governance structure of INTEGROS®.

Canonical Definition

Integrity Governance Architecture (INTEGROS®) is the integrity governance architecture that defines the structural conditions under which integrity remains formally defined, structurally organized, operationally measurable, continuously governable, resilient, recoverable, and continuously assured across complex operational environments throughout the complete integrity lifecycle.

Core Question

How can integrity remain continuously defined, measurable, governable, recoverable, and assured throughout the complete operational lifecycle?

Governance Flow

Integrity Definition → Integrity Structure → Integrity Conditions → Integrity Measurement → Integrity State → Integrity Deviation → Integrity Breach → Integrity Response → Integrity Restoration → Integrity Assurance

Core Parent Standards

1. Integrity Definition Standard (INDS)

Governed Space: Integrity Definition

Core Question: How can integrity be formally defined as a governable operational reality?

2. Integrity Structure Standard (STIS)

Governed Space: Integrity Structure

Core Question: How should integrity be structurally organized so that it can be consistently governed?

3. Integrity Conditions Standard (ICS)

Governed Space: Integrity Conditions

Core Question: Under which governed conditions can integrity legitimately exist, be preserved, and remain operationally valid?

4. Integrity Measurement Standard (IMS)

Governed Space: Integrity Measurement

Core Question: How can integrity be objectively measured, evaluated, and demonstrated?

5. Integrity State Standard (ISS)

Governed Space: Integrity State

Core Question: What is the current integrity state of a governed entity, and how can that state be objectively determined?

6. Integrity Deviation Standard (IDS)

Governed Space: Integrity Deviation

Core Question: When does integrity begin to deviate from approved conditions, and how can that deviation be governed before it becomes a breach?

7. Integrity Breach Standard (IBS)

Governed Space: Integrity Breach

Core Question: When does an integrity deviation become a governed integrity

breach requiring formal governance intervention?

8. Integrity Response Standard (IRS)

Governed Space: Integrity Response

Core Question: How should verified integrity breaches be governed, contained, and managed to minimize operational impact?

9. Integrity Restoration Standard (IRRS)

Governed Space: Integrity Restoration

Core Question: How can integrity be objectively restored after a verified breach while preserving governance accountability and evidence?

10. Integrity Assurance Standard (IAS)

Governed Space: Integrity Assurance

Core Question: How can restored integrity remain continuously verified, demonstrable, and governably assured throughout the complete operational lifecycle?

Compatible OOF® Architectures

INTEGROS® interoperates with multiple OOF® architectures governing complementary governance spaces.

GOA™ — Governance Architecture provides the constitutional governance layer defining how governance itself is structured.

ORA™ — Operational Reality Architecture governs operational execution, operational validity, operational coordination, and operational reality.

OBIDENTITY® — Identity Governance Architecture governs identity, ownership, provenance, authority, and continuity of governed entities.

AGA™ — Accountability Governance Architecture governs accountability relationships, responsibility allocation, delegation, and ownership structures.

CLIA® — Cognitive Governance Intelligence Architecture governs cognition, reasoning, interpretation, and cognitive governance.

MGIA™ — Memory Governance Intelligence Architecture governs memory continuity, memory integrity, organizational memory, and memory governance.

AIG® — AI Governance Architecture governs the behavioral governance lifecycle of AI systems.

ASGA™ — Autonomous Systems Governance Architecture governs autonomous systems, autonomous agents, and autonomous operational environments.

INTEGROS® serves as the common integrity governance architecture supporting the broader OOF® ecosystem by ensuring that governed entities maintain objective integrity throughout their complete operational lifecycle.

Architectural Position

INTEGROS® governs the complete integrity governance lifecycle.

The architecture progresses through:

Integrity Definition → Integrity Structure → Integrity Conditions → Integrity Measurement → Integrity State → Integrity Deviation → Integrity Breach → Integrity Response → Integrity Restoration → Integrity Assurance

Together these standards govern how integrity is formally defined, structurally organized, objectively measured, continuously monitored, protected against degradation, restored after verified breaches, and continuously assured across AI systems, autonomous systems, organizations, digital assets, critical infrastructure, and future operational environments.

Canonical Principle

INTEGROS® does not govern operational behavior or governance authority. INTEGROS® governs the integrity conditions under which governed entities remain objectively verifiable, resilient, recoverable, and continuously assured throughout their complete operational lifecycle.
