

Integrity State Classification Module (ISCM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-INTEGROS-ISS-ISCM-2026-07-21-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: INTEGROS® — Integrity Governance Architecture

Parent Standard: Integrity State Standard (ISS)

Operational Layer: Meta-Integrity Governance Layer

Category: Governance & Enforcement

Subcategory: Integrity Governance

Type: Parent Standard Module

Governed Space: Integrity State Classification

Version: 1.0

Status: Canonical · Open Module

Origin Date: 21 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · ART™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Integrity State Classification

Canonical Definition

Integrity State Classification Module (ISCM) defines the governance framework for classifying the current operational state of integrity. It establishes the standardized integrity state categories, classification criteria, and decision rules required to consistently determine and communicate the integrity condition of a governed entity throughout its complete lifecycle.

Operational Role

ISCM governs the classification layer of integrity state management by ensuring that every governed entity is assigned a consistent, objective, and standardized integrity state based on validated governance evidence.

Minimum Implementation Framework

1. Define Integrity State Categories

Identify the standardized integrity states used by the organization, such as maintained, degraded, compromised, suspended, restored, or other approved governance states.

2. Define Classification Requirements

Establish the governance criteria, evidence requirements, decision rules, and measurement dependencies required to assign each integrity state.

3. Define Classification Validation Logic

Define how integrity state classifications are verified for consistency, completeness, objectivity, and compliance with the approved governance methodology.

4. Define Governance Response

Establish governance actions associated with each integrity state, including monitoring, escalation, operational restrictions, corrective actions, restoration, or reassessment.

5. Preserve Classification Records

Maintain integrity state definitions, classification decisions, supporting evidence, state history, governance approvals, and audit records throughout the complete lifecycle.

Example Use Cases

Use Case 1 — Autonomous AI Platform

Scenario

An enterprise AI platform continuously evaluates operational integrity using governance measurements and evidence.

Application

ISCM classifies the platform as Maintained, Degraded, or Compromised according to standardized governance criteria.

Result

Integrity is represented consistently across all AI systems, enabling objective governance and operational decision-making.

Use Case 2 — Critical Infrastructure

Scenario

A national energy operator continuously evaluates the integrity of power grid operations using operational measurements, inspections, and compliance evidence.

Application

ISCM classifies the current integrity condition using standardized integrity state categories governed by the organization.

Result

Operators, auditors, and regulators share a common understanding of the operational integrity condition through consistent state classification.

Canonical Closing Statement

Integrity governance requires more than measurements—it requires a common language for representing operational reality. Integrity State Classification Module establishes the canonical framework for classifying integrity consistently, enabling objective governance decisions, standardized communication, and continuous integrity management throughout the complete lifecycle of every governed entity.
