

Integrity State Standard (ISS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-INTEGROS-ISS-2026-07-17-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: INTEGROS® — Integrity Governance Architecture

Operational Layer: Meta-Integrity Governance Layer

Category: Governance & Enforcement

Subcategory: Integrity Governance

Type: Parent Standard

Governed Space: Integrity State

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 17 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · ART™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Integrity State

Core Question

What is the current state of integrity?

Canonical Definition

Integrity State Standard (ISS) defines the governance conditions required to determine, classify, and maintain the current operational state of integrity.

It establishes the standardized integrity states, state transition rules, and governance criteria used to represent the actual integrity condition of a governed entity throughout its complete lifecycle.

Governance Flow Position

Definition → Structure → Conditions → Measurement → State → Deviation → Breach
→ Response → Restoration → Assurance

Standard Abstract

Integrity measurements provide objective evidence, but governance decisions require more than isolated measurements.

Measurements must be interpreted collectively to determine the actual operational condition of integrity.

Building upon the objective measurements established by IMS, Integrity State Standard defines how the current integrity condition is classified and represented.

ISS transforms measurements into governed operational states that can be monitored, compared, reported, and managed consistently across every governed entity.

Operational Role

Integrity State Standard governs the classification of integrity conditions. It establishes the governance framework used to determine whether integrity is maintained, degraded, unstable, compromised, suspended, restored, or operating under another formally defined state.

Operational Space

ISS governs:

- integrity state classification
- integrity state transitions
- state determination
- operational integrity status
- state consistency
- state governance
- lifecycle state management.

This governed space ensures that integrity conditions are represented consistently across operational, organizational, digital, and autonomous environments.

Why This Standard Exists

Objective measurements alone do not communicate the actual condition of integrity.

Organizations require standardized integrity states that summarize measurement results into meaningful governance conditions supporting operational decisions, reporting, certification, monitoring, and risk management.

ISS exists because Integrity State represents the fifth governed space of INTEGROS® — Integrity Governance Architecture, providing the canonical representation of integrity before deviations and breaches are identified.

Scope

This standard may be applied across:

- AI systems
- autonomous systems
- organizations
- digital identities
- digital assets
- operational processes
- software systems
- governance frameworks
- cognitive systems
- any governed entity requiring integrity state classification.

Relationship to Other OOF® Architectures

ISS governs the integrity state layer and interoperates with:

- GOA™
- OBIDENITY®
- ART™
- ORA™
- AGA™
- AIG®
- CLIA®
- MGIA™
- ASGA

by providing a common integrity state model that can be shared consistently across governance domains.

Foundational Principle

Integrity is governed not only by what is measured, but by the operational state those measurements collectively represent.

Canonical Closing Statement

Integrity State Standard establishes the canonical governance framework for determining, classifying, and managing the current operational condition of integrity. By governing integrity states, state transitions, and classification criteria, ISS provides the standardized representation upon which deviation detection, breach identification, response, restoration, and long-term assurance are built throughout the complete lifecycle of every governed entity.
