

Structural Dependency Integrity Module (SDIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-INTEGROS-STIS-SDIM-2026-07-17-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: INTEGROS® — Integrity Governance Architecture

Parent Standard: Structural Integrity Standard (STIS)

Operational Layer: Meta-Integrity Governance Layer

Category: Governance & Enforcement

Subcategory: Integrity Governance

Type: Parent Standard Module

Governed Space: Structural Dependency Integrity

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · ART™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Structural Dependency Integrity

Canonical Definition

Structural Dependency Integrity Module (SDIM) defines the governance conditions required to identify, validate, monitor, and preserve the integrity of dependencies between structural components. It ensures that every dependency remains legitimate, transparent, resilient, and governable throughout the complete lifecycle of a governed entity.

Operational Role

SDIM governs the dependency layer of structural integrity. It ensures that every governed dependency is explicitly identified, continuously validated, and managed so that changes or failures in one component do not compromise the integrity of the overall structure.

Minimum Implementation Framework

1. Define Structural Dependencies

Identify every dependency between structural components, including functional, operational, organizational, technical, governance, and external dependencies that influence structural integrity.

2. Define Dependency Integrity Requirements

Establish the governance conditions that every dependency must satisfy, including legitimacy, availability, consistency, traceability, resilience, and continuity.

3. Define Dependency Failure Logic

Identify the conditions under which a dependency becomes unavailable, invalid, inconsistent, broken, unauthorized, obsolete, or otherwise incapable of supporting structural integrity.

4. Define Governance Response

Define governance actions for validating, replacing, mitigating, removing, restructuring, or approving dependency changes whenever dependency integrity is compromised.

5. Preserve Dependency Records

Preserve dependency maps, governance approvals, dependency changes, validation history, supporting evidence, and lifecycle records necessary to demonstrate dependency integrity.

Example Use Cases

Use Case 1 — Financial Services Platform

Scenario

A financial institution operates multiple interconnected services, including customer identity, transaction processing, fraud detection, and regulatory reporting, all of which depend on one another.

Application

SDIM identifies and governs every dependency between these services, ensuring that changes to one service do not unintentionally compromise the structural integrity of the entire platform.

Result

The institution maintains resilient and transparent service dependencies, reducing operational risk while preserving structural integrity across the complete financial ecosystem.

Use Case 2 — Autonomous Multi-Agent System

Scenario

A fleet of autonomous agents depends on shared memory services, identity infrastructure, orchestration components, external sensors, and governance policies to coordinate operations.

Application

SDIM maps and continuously validates every operational and governance dependency, ensuring that dependency failures are detected and managed before they affect the integrity of the system.

Result

The autonomous ecosystem maintains dependable structural relationships, allowing agents to operate safely and consistently despite changes in individual components or supporting infrastructure.

Canonical Closing Statement

Integrity depends not only on components and relationships, but also on the dependencies that connect them. Structural Dependency Integrity Module ensures that every governed dependency remains visible, resilient, and continuously governable, preserving the structural integrity of the complete governed entity throughout its lifecycle.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.
