

Structure Mapping Module (STMM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-INTEGROS-STIS-STMM-2026-07-17-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: INTEGROS® — Integrity Governance Architecture

Parent Standard: Structural Integrity Standard (STIS)

Operational Layer: Meta-Integrity Governance Layer

Category: Governance & Enforcement

Subcategory: Integrity Governance

Type: Parent Standard Module

Governed Space: Structural Mapping

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · ART™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Structural Mapping

Canonical Definition

Structure Mapping Module (STMM) defines the canonical structural representation of a governed entity by identifying its components, relationships, dependencies, hierarchy, and organizational arrangement. It establishes the structural reference required to preserve, evaluate, and govern integrity throughout the complete lifecycle of the entity.

Operational Role

STMM establishes the official structural map upon which every subsequent structural integrity activity depends. It provides the governed representation of how the entity is organized before structural integrity can be measured, monitored, evaluated, or assured.

Minimum Implementation Framework

1. Define the Governed Structure

Identify the governed entity and define every structural component that forms its integrity architecture. All components, organizational units, assets, services, processes, or functional elements requiring integrity governance shall be explicitly identified and documented.

2. Define Structural Relationships

Establish the relationships, dependencies, hierarchy, interactions, and organizational connections between structural components. The structural map shall accurately represent how components interact and collectively preserve structural integrity.

3. Define Structural Failure Logic

Identify the conditions under which the structural model becomes incomplete, inconsistent, fragmented, ambiguous, obsolete, or incapable of preserving integrity. Define how structural weaknesses and missing relationships are detected.

4. Define Governance Response

Define governance actions for validating, updating, correcting, restructuring, approving, or rejecting structural changes whenever modifications affect the governed integrity structure.

5. Preserve Structural Records

Preserve structural maps, governance approvals, dependency records, relationship definitions, structural revisions, version history, and supporting evidence required to demonstrate structural integrity throughout the complete lifecycle.

Example Use Cases

Use Case 1 — Corporate Governance

Scenario

An organization prepares for an enterprise-wide governance assessment and must establish a complete representation of its governance structure before evaluating structural integrity.

Application

STMM maps all governance bodies, organizational units, reporting relationships, operational processes, critical assets, and structural dependencies into a single governed structural model.

Result

The organization obtains a complete structural reference that enables consistent structural integrity assessment, governance analysis, and controlled structural evolution.

Use Case 2 — Autonomous AI System

Scenario

An autonomous AI platform contains multiple decision engines, memory services, identity services, governance controls, external interfaces, and runtime components that operate together.

Application

STMM creates the canonical structural map of the complete AI architecture by documenting every governed component, dependency, hierarchy, and interaction before structural integrity is evaluated.

Result

The AI system becomes structurally governable, allowing integrity assessments, governance decisions, and future architectural changes to be performed against a complete and continuously maintained structural reference.

Canonical Closing Statement

Integrity can only be preserved when the underlying structure is fully understood. Structure Mapping Module establishes the canonical structural representation that enables every structural integrity assessment, governance decision, and assurance activity throughout the complete lifecycle of a governed entity.
