

JOIM — Judgment Ownership Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-JOIM-2026-06-03-0001

Architecture Ecosystem: Cognitive Governance Intelligence Architecture (CLIA®)

Architecture Family: Human Cognition Governance

Operational Layer: Human Cognition Integrity Layer

Governed Space: Judgment Ownership Integrity

Category: AI & Interpretation

Subcategory: Human Judgment Governance

Type: Human Cognition Integrity Module

Parent Standard: Human Cognition Integrity Standard (HCIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·

Human Cognition Integrity Standard (HCIS) ·

Cognitive Integrity Standard (CIS) ·

Human-AI Cognition Integrity Standard (HAICS) ·

Cognitive Reasoning Integrity Standard (CRIS) ·

Ethical Virtual Integrity Protocol (EVIP) ·

INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Judgment Ownership Integrity Module (JOIM) defines the structural conditions under which human judgment remains materially owned, exercisable, challengeable, accountable, and operationally valid during interaction with AI systems, decision-support systems, autonomous agents, and external cognitive environments.

JOIM governs judgment ownership.

The module ensures that humans remain the legitimate owners of their judgments even when recommendations, predictions, analyses, or conclusions originate from external cognitive systems.

A system satisfies JOIM only if:

- judgment ownership remains human
- judgment authority remains exercisable
- external conclusions remain challengeable
- decision responsibility remains identifiable

- judgment displacement remains detectable
- human evaluation remains preservable

A cognition environment that transfers judgment ownership from humans to external systems does not satisfy JOIM.

Module Operational Role

JOIM defines the judgment-ownership governance layer of HCIS.

Its role is to preserve human cognitive legitimacy by ensuring that final judgment remains materially owned by the human participant.

Module Operational Space

JOIM governs:

- judgment ownership
- judgment authority
- decision accountability
- cognitive responsibility
- conclusion acceptance governance
- judgment displacement detection
- human evaluation rights
- cognitive legitimacy

The module applies wherever humans rely on external systems for information, recommendations, interpretation, or analysis.

Module Function

The module applies wherever humans must preserve:

- ownership of conclusions
- accountability for decisions
- authority over judgment
- independent evaluation
- challenge capability
- governance-valid cognition

Its function is to ensure that assistance does not become judgment replacement.

Minimum Implementation Framework

1. Define the Judgment Object

The organization must define which decisions and conclusions require judgment ownership governance.

This may include:

- strategic decisions
 - operational decisions
 - risk assessments
 - AI-assisted recommendations
 - policy decisions
 - educational evaluations
-

- analytical conclusions
- human-AI collaboration outcomes

2. Define Judgment Ownership Conditions

The system must define the conditions under which judgment remains human-owned.

This includes:

- accountability requirements
- review requirements
- challenge rights
- decision authority requirements
- evaluation conditions
- ownership preservation requirements

3. Define Judgment Displacement Detection Logic

The system must define how judgment displacement is identified.

This may include:

- automatic acceptance patterns
- recommendation dependency indicators
- review omission detection
- authority transfer indicators
- evaluation bypass detection
- accountability ambiguity detection

4. Define Operational Response or Governance Logic

The system must define governance logic for judgment-displacement conditions.

Governance response may include:

- mandatory review requirements
- judgment confirmation steps
- challenge procedures
- accountability verification
- escalation
- human validation requirements
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- judgment decisions
- evaluation actions
- review activities
- accountability assignments
- challenge events
- governance interventions

A cognition environment must not remain judgment-valid if humans materially lose ownership over decisions that remain attributed to them.

Use Case 1 — AI-Assisted Executive Governance

Scenario

Executives regularly receive AI-generated strategic recommendations regarding investments, operations, and risk management.

Application

JOIM governs whether leaders actively exercise judgment authority rather than simply accepting machine-generated recommendations.

Result

The organization gains stronger accountability, clearer decision ownership, and reduced judgment outsourcing.

Use Case 2 — Clinical Decision-Support Environment

Scenario

Medical professionals use advanced AI systems to support diagnosis, treatment planning, and patient assessment.

Application

JOIM governs whether healthcare professionals retain ownership of clinical judgment despite extensive AI assistance.

Result

The environment gains stronger accountability, preserved professional responsibility, and reduced risk of judgment displacement.

Canonical Closing Statement

Judgment Ownership Integrity Module (JOIM) defines the structural conditions under which human judgment remains materially owned, exercisable, challengeable, accountable, and operationally valid during interaction with AI systems, decision-support systems, autonomous agents, and external cognitive environments.

Humans do not preserve cognition merely by remaining present.
Human cognition remains legitimate only when judgment itself remains owned by the human mind.
