

MAIM — Memory Accountability Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-MAIM-2026-06-08-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Memory Integrity Governance Layer

Governed Space: Memory Accountability Integrity

Category: AI & Interpretation

Subcategory: Memory Accountability Governance

Type: Memory Integrity Module

Parent Standard: Memory Integrity Standard (MIS)

Version: 1.0

Status: Canonical · Open Module

Effective Date: 8 June 2026

Compatibility: OOF Methodology OS · Memory Integrity Standard (MIS) ·
Memory Continuity Integrity Module (MCIM) · Memory Traceability Integrity Module (MTIM) ·
Memory Boundary Integrity Module (MBIM) · Memory State Integrity Module (MSIM) ·
Memory Governance Standard (MGS) · Evolution Accountability Integrity Module (EAIM) ·
INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Memory Accountability Integrity Module (MAIM) defines the structural conditions under which memory creation, storage, modification, retrieval, sharing, preservation, deletion, and utilization remain attributable, traceable, reviewable, governable, and operationally accountable throughout the memory lifecycle.

MAIM governs memory accountability.

The module ensures that memory remains linked to responsibility, authority, ownership, and consequence-bearing actions rather than becoming an anonymous, ungovernable, or responsibility-detached memory environment.

A system satisfies MAIM only if:

- memory ownership remains identifiable
- memory actions remain attributable
- accountability relationships remain visible
- responsibility remains preservable
- governance oversight remains assessable

- accountability remains operationally valid

A memory environment that cannot determine who created, modified, utilized, or governed memory does not satisfy MAIM.

Module Operational Role

MAIM defines the memory-accountability governance layer of MIS.

Its role is to preserve accountability throughout the memory lifecycle.

Module Operational Space

MAIM governs:

- memory accountability
- memory ownership
- responsibility attribution
- memory governance
- memory oversight
- memory authority
- consequence-bearing memory actions
- accountability preservation

The module applies wherever memory influences cognition, decisions, operations, governance, or future outcomes.

Module Function

The module applies wherever systems must preserve:

- accountable memory actions
- visible ownership
- traceable responsibility
- governance-valid memory usage
- reconstructable memory history
- operationally reliable memory governance

Its function is to ensure that memory remains linked to accountable actors and accountable actions.

Minimum Implementation Framework

1. Define the Memory Accountability Object

The organization must define which memory activities require accountability governance. This may include:

- memory creation
- memory modification
- memory retrieval
- memory sharing
- memory preservation
- memory deletion
- memory governance
- Human-AI memory activities

2. Define Memory Accountability Conditions

The system must define the conditions under which accountability remains valid.

This includes:

- ownership requirements
- attribution requirements
- responsibility requirements
- oversight requirements
- governance requirements
- accountability-valid conditions

3. Define Accountability Degradation Detection Logic

The system must define how accountability degradation is identified.

This may include:

- anonymous memory actions
- ownership ambiguity
- responsibility loss
- governance-blind modifications
- unattributed memory utilization
- accountability gaps

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-integrity failures.

Governance response may include:

- accountability review
- ownership verification
- governance intervention
- escalation
- responsibility reassignment
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- ownership assignments
- memory actions
- modification activities
- governance reviews
- intervention actions
- resulting memory states

A memory environment must not remain accountability-valid if materially significant memory activities cannot be attributed, reconstructed, reviewed, or governed.

Use Case 1 — Enterprise AI Memory Environment

Scenario

An enterprise AI environment continuously stores, updates, retrieves, and shares memory objects used for operational decisions and future actions.

Application

MAIM governs ownership, accountability, responsibility attribution, and governance oversight throughout the memory lifecycle.

Result

The organization gains stronger accountability visibility, improved governance reliability, and reduced exposure to anonymous memory manipulation.

Use Case 2 — Human-AI Knowledge Ecosystem

Scenario

Humans and AI systems jointly create, update, preserve, and utilize shared memory assets over long periods of time.

Application

MAIM governs responsibility attribution, ownership visibility, and accountability preservation across Human-AI memory activities.

Result

The ecosystem gains stronger trust, improved governance transparency, and reduced exposure to accountability loss.

Canonical Closing Statement

Memory Accountability Integrity Module (MAIM) defines the structural conditions under which memory creation, storage, modification, retrieval, sharing, preservation, deletion, and utilization remain attributable, traceable, reviewable, governable, and operationally accountable throughout the memory lifecycle.

Memory cannot remain governable if nobody is accountable for it. Memory accountability therefore becomes a foundational integrity condition of governable memory systems.
