

Memory Authority Integrity Module (MAUIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-MAUIM-2026-06-12-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Memory Governance Layer

Governed Space: Memory Authority Integrity

Category: AI & Interpretation

Subcategory: Memory Authority Governance

Type: Memory Governance Standard Module

Parent Standard: Memory Governance Standard (MGS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Memory Governance Standard (MGS) · Memory Integrity Standard (MIS) · Agent Memory Integrity Standard (AMIS) · User Memory Integrity Standard (UMIS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Memory Authority Integrity Module (MAUIM) defines the structural conditions under which authority over memory creation, modification, access, preservation, deletion, governance, and utilization remains identifiable, traceable, accountable, reviewable, and operationally valid throughout the memory lifecycle.

MAUIM governs memory authority.

The module ensures that authority affecting memory remains clearly defined rather than ambiguous, hidden, conflicting, or uncontrolled.

A system satisfies MAUIM only if:

- authority remains identifiable
- authority boundaries remain visible
- authority delegation remains traceable
- authority conflicts remain detectable
- authority governance remains possible
- memory authority remains operationally valid

A memory environment that cannot identify who possesses authority over memory does not satisfy MAUIM.

Module Operational Role

MAUIM defines the authority-governance layer of MGS.

Its role is to preserve legitimacy and traceability of authority affecting memory.

Module Operational Space

MAUIM governs:

- memory authority
- authority delegation
- authority boundaries
- governance authority
- memory stewardship authority
- authority accountability
- authority traceability
- authority governance

The module applies wherever memory decisions require authority.

Module Function

The module applies wherever systems must preserve:

- accountable authority
- visible governance structures
- traceable decision rights
- governance-valid authority assignment
- reliable stewardship
- trustworthy memory control

Its function is to ensure that authority over memory remains understandable and governable.

Minimum Implementation Framework

1. Define the Memory Authority Object

The organization must define which memory environments require authority governance.

This may include:

- AI memory systems
- autonomous agents
- Human-AI environments
- organizational knowledge systems
- collective memory systems
- governance repositories
- institutional archives
- operational memory environments

2. Define Memory Authority Conditions

The system must define the conditions under which authority remains valid.

This includes:

- authority requirements
- delegation requirements
- traceability requirements
- accountability requirements
- oversight requirements
- governance-valid authority conditions

3. Define Authority Degradation Detection Logic

The system must define how authority failures are identified.

This may include:

- unclear authority
- conflicting authority
- unauthorized control
- governance gaps
- stewardship ambiguity
- authority drift

4. Define Operational Response or Governance Logic

The system must define governance logic for authority-integrity failures.

Governance response may include:

- authority review
- delegation verification
- governance intervention
- escalation
- authority correction
- stewardship reassignment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- authority assignments
- delegation events
- governance reviews
- intervention procedures
- validation activities
- resulting authority states

A memory-governance environment must not remain authority-valid if materially significant authority relationships cannot be reconstructed, reviewed, validated, or governed.

Use Case 1 — Autonomous Agent Governance

Scenario

An autonomous agent possesses the capability to create, modify, and utilize memory while interacting with users and external systems.

Application

MAUIM governs authority boundaries and delegation rights affecting memory operations.

Result

The environment gains stronger governance visibility and reduced exposure to unauthorized memory control.

Use Case 2 — Enterprise Knowledge Governance

Scenario

An organization manages institutional knowledge across departments, teams, managers, and AI systems.

Application

MAUIM governs authority assignments and accountability of memory stewardship.

Result

The organization gains stronger governance clarity and improved trustworthiness of memory operations.

Canonical Closing Statement

Memory Authority Integrity Module (MAUIM) defines the structural conditions under which authority over memory creation, modification, access, preservation, deletion, governance, and utilization remains identifiable, traceable, accountable, reviewable, and operationally valid throughout the memory lifecycle.

**Memory governance cannot remain trustworthy if authority is unclear.
Memory authority integrity therefore becomes a foundational integrity condition
of trustworthy memory governance systems.**
