

Memory Governance Accountability Integrity Module (MGAIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-MGAIM-2026-06-12-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Memory Governance Layer

Governed Space: Memory Governance Accountability Integrity

Category: AI & Interpretation

Subcategory: Memory Governance Accountability

Type: Memory Governance Standard Module

Parent Standard: Memory Governance Standard (MGS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Memory Governance Standard (MGS)

- Memory Authority Integrity Module (MAUIM) · Memory Access Integrity Module (MACIM)
- Memory Oversight Integrity Module (MOIM) · Memory Auditability Integrity Module (MAUDIM)
- INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Memory Governance Accountability Integrity Module (MGAIM) defines the structural conditions under which memory-governance decisions, authority assignments, access permissions, oversight activities, audit processes, stewardship actions, and governance interventions remain attributable, traceable, reviewable, governable, and operationally accountable throughout the memory lifecycle.

MGAIM governs memory governance accountability.

The module ensures that governance itself remains accountable and that no governance action affecting memory exists outside traceability, responsibility, and review.

A system satisfies MGAIM only if:

- governance actions remain attributable
- accountability relationships remain visible
- governance decisions remain traceable
- responsibility assignments remain identifiable
- governance oversight remains reviewable
- governance accountability remains operationally valid

A memory-governance environment that cannot identify who governed memory, who

approved decisions,
or who bears responsibility for governance outcomes does not satisfy MGAIM.

Module Operational Role

MGAIM defines the accountability-governance layer of MGS.

Its role is to preserve accountability across all memory-governance activities.

Module Operational Space

MGAIM governs:

- governance accountability
- governance responsibility
- governance attribution
- governance traceability
- governance stewardship
- governance oversight accountability
- governance intervention accountability
- governance reviewability

The module applies wherever memory governance decisions are made.

Module Function

The module applies wherever systems must preserve:

- accountable governance
- visible responsibility chains
- reviewable governance decisions
- governance-valid stewardship
- transparent authority structures
- trustworthy memory governance

Its function is to ensure that governance remains accountable to the environments it governs.

Minimum Implementation Framework

1. Define the Memory Governance Accountability Object

The organization must define which governance activities require accountability governance.

This may include:

- authority assignments
 - access approvals
 - oversight activities
 - audit reviews
 - governance interventions
 - stewardship activities
 - memory-policy decisions
-

- Human-AI governance environments

2. Define Governance Accountability Conditions

The system must define the conditions under which governance accountability remains valid.

This includes:

- attribution requirements
- responsibility requirements
- traceability requirements
- reviewability requirements
- oversight requirements
- governance-valid accountability conditions

3. Define Accountability Degradation Detection Logic

The system must define how governance-accountability failures are identified.

This may include:

- anonymous governance decisions
- undocumented approvals
- unclear responsibility chains
- governance gaps
- accountability failures
- stewardship ambiguity

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-integrity failures.

Governance response may include:

- accountability review
- attribution verification
- governance intervention
- escalation
- stewardship reassignment
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- governance decisions
- responsibility assignments
- oversight activities
- audit reviews
- intervention procedures
- resulting governance states

A memory-governance environment must not remain accountability-valid

if materially significant governance activities cannot be attributed, reconstructed, reviewed, or governed.

Use Case 1 — Autonomous Agent Governance Platform

Scenario

Multiple autonomous agents operate under a shared governance framework that controls memory access, modification, learning, and evolution.

Application

MGAIM governs accountability of governance decisions affecting agent memory systems.

Result

The environment gains stronger governance transparency and reduced exposure to unaccountable memory-control decisions.

Use Case 2 — Enterprise Knowledge Governance Authority

Scenario

An organization manages memory governance across departments, AI systems, operational units, and institutional knowledge repositories.

Application

MGAIM governs accountability of governance decisions, stewardship actions, and authority assignments.

Result

The organization gains stronger governance trustworthiness, improved responsibility visibility, and reduced exposure to governance ambiguity.

Canonical Closing Statement

Memory Governance Accountability Integrity Module (MGAIM) defines the structural conditions under which memory-governance decisions, authority assignments, access permissions, oversight activities, audit processes, stewardship actions, and governance interventions remain attributable, traceable, reviewable, governable, and operationally accountable throughout the memory lifecycle.

**Governance without accountability becomes authority without responsibility.
Memory governance accountability therefore becomes a foundational integrity condition
of trustworthy memory governance systems.**
