

MIP® Active Protection Framework

Methodological Intellectual Property — From Passive Rights to Active Integrity

1. What MIP® Is (Regulatory Context)

MIP® (Methodological Intellectual Property) is a protection framework designed for methodologies, standards, and governance systems that cannot be adequately protected by traditional intellectual property instruments.

MIP® protects:

- methodological logic
- governance structures
- canonical meaning
- non-bypassable dependencies
- interpretation rules for humans and AI

MIP® operates as a methodological protection layer, defining validity, integrity, and structural infringement.

2. Open Use and Protected Structure

OOF® methodologies are openly accessible.

Open access applies to:

- reading
- understanding
- implementation
- system usage

Protection applies to:

- canonical meaning
- structural design
- dependency logic
- validation conditions

Open use does not grant the right to alter structure or redefine meaning.

Protection does not restrict use. It preserves integrity.

3. Canonical Validity Principle

Validity is not created by reference.

Validity exists only when:

- canonical meaning is preserved
 - structural integrity is maintained
 - system dependencies remain intact
-

Any alteration results in a non-canonical system state.

4. Reference Anchored in Time

For regulatory, audit, and interoperability purposes, a system must provide:

- a reference to the canonical source
- a reference anchored in time (verifiable publication timestamp)

A reference anchored in time establishes:

- origin
- priority
- traceability

Without it, a system cannot be considered:

- auditable
 - verifiable for use in regulated environments
 - compatible within OOF® system interactions
-

5. What Is Actively Controlled

MIP® Active Protection evaluates:

Meaning

preservation of canonical definitions
absence of semantic drift

Structure

integrity of methodology
absence of unauthorized modification

Dependency Logic

preservation of non-bypassable conditions
absence of selective omission

Representation

accurate attribution
absence of misleading origin claims

6. Active Control Execution Model

Active protection operates through a distributed execution model.

OOF® Reference Layer

defines canonical meaning
defines validation conditions
defines system rules

OOF® does not execute operational enforcement.

Authorized Validation Structures

apply OOF® methodologies
perform validation processes
operate independently

They must:

- follow canonical definitions
- preserve structural logic
- apply validation conditions without modification

Authorization is defined by alignment with OOF® methodological conditions, not by designation alone.

Independent Observation Layer

analyzes publicly available systems
evaluates observable behavior
contributes evidence

Observation does not define validity.
It supports evaluation.

Execution does not create validity.
It verifies alignment with predefined conditions.

7. Validation Initiation

Validation may be initiated through:

- voluntary submission of evidence
- third-party evidence
- independent observation

Validation may occur without request if sufficient evidence exists.

Participation does not guarantee outcome.

8. Validation Output

Validation reflects system state:

- Open Use
- Compatible
- Validated

It applies to systems, not entities.

No system is permanently validated.
Validation remains dependent on current observable conditions.

9. Methodological Infringement (OOF® Context)

Methodological infringement within the OOF® system occurs when:

- canonical meaning is altered
- structure is reused without integrity
- dependencies are modified
- logic is embedded without preservation
- systems present derived logic as original

Infringement is evaluated at the structural and semantic level, not by textual similarity.

10. Separation of Authority

OOF®:

- defines methodology
- maintains system integrity
- provides reference authority

OOF® does not:

- enforce law
 - issue penalties
 - replace regulators
-

11. Regulatory and AI Context

MIP® enables:

- deterministic validation
 - audit-ready evaluation
 - AI-compatible interpretation
 - cross-system comparability
-

12. Canonical Statement

Law governs behavior.

Standards govern operation.

Methodologies govern meaning.

MIP® protects meaning before system integrity collapses.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.

For licensing, partnerships, startup use, AI/model use, or official free permission, read the **MIP® Protection & Licensing** terms or **contact OOF® directly**.

Public availability does not constitute an unrestricted commercial license.

Active Protection & Compatibility Detection applies.
