

MEIS — Memory Evolution Integrity Standard

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-MEIS-2026-06-12-0008

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Memory Evolution Governance Layer

Governed Space: Memory Evolution Integrity

Category: AI & Interpretation

Subcategory: Memory Evolution Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · Memory Integrity Standard (MIS) ·

Agent Memory Integrity Standard (AMIS) · User Memory Integrity Standard (UMIS) ·

Temporal Memory Integrity Standard (TMIS) · Collective Memory Integrity Standard (CMIS) ·

Cognitive Evolution Governance Standard (CEGS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Memory Evolution Integrity Standard (MEIS) defines the structural conditions under which memory remains capable of evolving, adapting, updating, refining, expanding, reorganizing, and improving while preserving continuity, traceability, accountability, and operational validity throughout the memory lifecycle.

MEIS governs memory evolution.

The standard establishes the integrity conditions required for governing how memory changes over time.

Memory is not static.

Memory evolves.

MEIS governs whether that evolution remains valid.

A. Standard Abstract

Every memory system changes.

Humans learn.

Organizations learn.

AI systems learn.

Civilizations learn.

Knowledge evolves.

Memory evolves.

Without governance:

- memory may become corrupted
- historical continuity may break
- updates may become untraceable
- learning may become unreliable
- evolution may become destructive

MEIS exists to govern these conditions.

B. Core Principle

Memory evolution becomes valid only when memory changes remain traceable, reconstructable, accountable, continuous, and operationally valid throughout the memory lifecycle.

C. Scope

This standard may apply to:

- AI memory systems
- autonomous agents
- Human-AI environments
- organizations
- collective intelligence systems
- adaptive memory environments
- self-improving systems
- future intelligence ecosystems

MEIS applies wherever memory changes over time.

D. Why This Standard Exists

Most memory standards govern memory state.

MEIS governs memory change.

Examples include:

- learning
 - adaptation
 - memory refinement
 - memory correction
 - memory expansion
 - memory reorganization
-

- memory optimization

The challenge is not preserving static memory.

The challenge is preserving trustworthy memory evolution.

MEIS exists because memory evolution has become a distinct governance space.

E. Memory Evolution Integrity Logic

Memory evolution integrity exists only when the following remain materially preservable:

1. Memory Change Integrity

Memory modifications remain valid.

2. Memory Adaptation Integrity

Adaptation remains governable.

3. Memory Continuity Integrity

Evolution preserves continuity.

4. Memory Learning Integrity

Learning remains traceable.

5. Memory Evolution Accountability Integrity

Evolution remains accountable.

F. Operational Architecture Space

MEIS defines the operational architecture space for:

- memory evolution governance
- memory adaptation
- memory learning
- memory refinement
- memory optimization
- memory continuity
- memory traceability
- memory accountability

This space exists because intelligence depends not only on memory,

but on how memory evolves.

MEIS governs whether that evolution remains valid.

G. Difference Between Memory and Memory Evolution

Memory governs what is remembered.

Memory evolution governs how memory changes.

MIS governs memory integrity.

MEIS governs integrity of memory transformation.

Both are required.

H. Runtime Position

MEIS operates across:

- AMIS
- UMIS
- GMIS
- TMIS
- MMIS
- CMIS

MEIS governs memory evolution across the entire MGIA™ architecture.

I. Memory Evolution Failure Rule

Memory evolution failure occurs when memory changes become unreliable.

Examples include:

- uncontrolled adaptation
- memory corruption through updates
- continuity breaks
- untraceable learning
- destructive optimization
- unverifiable memory evolution

MEIS exists to expose and govern these conditions.

J. Validity Logic

A memory-evolution environment is valid under MEIS when:

- evolution remains traceable
- continuity remains preserved
- adaptation remains accountable
- learning remains reconstructable
- optimization remains governable
- evolution remains operationally valid

A memory-evolution environment becomes invalid when:

- memory changes cannot be explained
 - continuity disappears
 - learning becomes unverifiable
 - adaptation becomes uncontrolled
-

K. Relationship to Other OOF Standards

MEIS derives from:

Memory Integrity Standard (MIS)

and supports:

- Cognitive Evolution Governance Standard (CEGS)
- Future Adaptive Intelligence Architectures
- Future Self-Improving Agent Systems

MEIS governs memory evolution.

Other memory standards govern memory states.

L. Foundational Principle

Intelligence depends not only on memory,
but on the ability of memory to evolve without losing integrity.

Canonical Closing Statement

Memory Evolution Integrity Standard (MEIS) defines the structural conditions under which memory remains capable of evolving, adapting, updating, refining, expanding, reorganizing, and improving while preserving continuity, traceability, accountability, and operational validity throughout the memory lifecycle.

Memory that cannot evolve becomes obsolete.

Memory that evolves without integrity becomes unreliable.

**Memory evolution integrity therefore becomes
a foundational condition of trustworthy adaptive intelligence systems.**
