

MGS — Memory Governance Standard

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-MGS-2026-06-12-0009

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Operational Layer: Memory Governance Layer

Governed Space: Memory Governance

Category: AI & Interpretation

Subcategory: Memory Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 12 June 2026

Compatibility: OOF Methodology OS · MIS · AMIS · UMIS · GMIS · TMIS
· MMIS · CMIS · MEIS · CLIA® · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Memory Governance Standard (MGS) defines the structural conditions under which memory systems, memory environments, memory operations, memory decisions, memory access, memory modification, memory preservation, memory utilization, and memory evolution remain governable, accountable, auditable, controllable, reviewable, and operationally valid throughout the memory lifecycle.

MGS governs memory governance.

The standard establishes the governance conditions required for managing memory across human, organizational, artificial, collective, autonomous, and future intelligence environments.

While other MGIA™ standards govern memory itself,

MGS governs how memory is governed.

A. Standard Abstract

Memory creates power.
Memory influences decisions.
Memory influences cognition.

Memory influences learning.

Memory influences behavior.

The question therefore becomes:

Who governs memory?

Without governance:

- memory may be manipulated
- memory may be corrupted
- memory access may become uncontrolled
- accountability may disappear
- oversight may fail
- trust may deteriorate

MGS exists to govern these conditions.

B. Core Principle

Memory becomes trustworthy only when memory governance remains visible, accountable, auditable, reviewable, controllable, and operationally valid throughout the memory lifecycle.

C. Scope

This standard may apply to:

- AI systems
- autonomous agents
- robotics
- Human-AI environments
- organizations
- institutions
- collective intelligence systems
- future intelligence ecosystems

MGS applies wherever memory requires governance.

D. Why This Standard Exists

Previous MGIA™ standards govern:

- memory integrity
 - user memory
 - agent memory
 - group memory
 - temporal memory
 - multimodal memory
 - collective memory
 - memory evolution
-

MGS governs all of them.
The challenge is not merely memory.
The challenge is governance of memory.

E. Memory Governance Integrity Logic

Memory governance integrity exists only when the following remain materially preservable:

1. Memory Authority Integrity

Authority over memory remains identifiable.

2. Memory Access Integrity

Access remains governable.

3. Memory Oversight Integrity

Oversight remains operational.

4. Memory Auditability Integrity

Memory actions remain auditable.

5. Memory Governance Accountability Integrity

Governance actions remain accountable.

F. Operational Architecture Space

MGS defines the operational architecture space for:

- memory governance
- memory authority
- memory oversight
- memory auditability
- memory accountability
- memory control
- memory access governance
- memory stewardship

This space exists because memory increasingly influences intelligence, decisions, and behavior.
MGS governs whether memory governance remains valid.

G. Difference Between Memory and Memory Governance

Memory governs what is remembered.
Memory governance governs who controls memory and how memory is managed.
MIS governs memory.
MGS governs governance of memory.
Both are required.

H. Runtime Position

MGS operates above:

- MIS
- AMIS
- UMIS
- GMIS
- TMIS
- MMIS
- CMIS
- MEIS

MGS serves as the governance layer of the entire MGIA™ architecture.

I. Memory Governance Failure Rule

Memory governance failure occurs when governance becomes unreliable.

Examples include:

- unauthorized memory modification
- uncontrolled access
- invisible governance actions
- audit failure
- accountability failure
- governance corruption

MGS exists to expose and govern these conditions.

J. Validity Logic

A memory-governance environment is valid under MGS when:

- authority remains identifiable
- governance remains visible
- access remains controllable
- oversight remains operational
- auditability remains possible
- accountability remains preserved

A memory-governance environment becomes invalid when:

- governance becomes invisible
 - authority becomes unclear
 - accountability disappears
 - auditability collapses
-

K. Relationship to Other OOF Standards

MGS derives from:

Memory Integrity Standard (MIS)

and governs:

- AMIS
- UMIS
- GMIS
- TMIS
- MMIS
- CMIS
- MEIS

MGS acts as the governance umbrella of MGIA™.

L. Foundational Principle

Memory influences intelligence. Governance influences memory.
Therefore governance indirectly influences intelligence.

Canonical Closing Statement

Memory Governance Standard (MGS) defines the structural conditions under which memory systems, memory environments, memory operations, memory decisions, memory access, memory modification, memory preservation, memory utilization, and memory evolution remain governable, accountable, auditable, controllable, reviewable, and operationally valid throughout the memory lifecycle.

Memory cannot remain trustworthy without governance.
Memory governance therefore becomes a foundational condition
of trustworthy intelligence systems, autonomous agents,
Human-AI environments, and future memory architectures.
