

VTTS™ — Minimal Implementation Framework

OOF™ Origin Open Foundation™

Independent Methodological Authority

Category: Economic & Value

Module: VTTS™ — Value Transfer Taxation Standard

Type: Implementation Framework

Version: 1.0

Status: Canonical · Minimal Implementation

Effective Date: 8 April 2026

Compatibility: VTTS™ · VTDS · DVIS · VFM™ · ART™

A. Framework Purpose

This framework defines a minimal operational model for applying the Value Transfer Taxation Standard (VTTS™) within:

- digital platforms
- financial systems
- AI-driven systems
- state-level infrastructures

The objective is:

to enable taxation at the moment of value transfer with minimal system complexity

B. Core Implementation Principle

Tax is applied at the Value Capture Point

A system must detect:

- when value becomes transferable
 - when ownership or control changes
-

C. Minimal System Requirements

A compliant system must implement only the following:

1. Value Event Detection

The system must detect:

- value creation (optional)
- value transfer (mandatory)

Only transfer triggers taxation.

2. Entity Identification

Each value transfer must include:

- source entity
- destination entity

Entities may be:

- individuals
- organizations
- AI agents
- system-controlled accounts

3. Value Quantification

Each transfer must include:

- measurable value
- unit of value (currency, asset type, token, etc.)

4. Value Capture Trigger

Tax must be triggered when:

- transfer is executed
- value becomes accessible or controllable

5. Recordability

Each event must be:

- recorded
 - timestamped
 - auditable
-

D. Minimal Taxation Flow

For each value transfer:

- Detect transfer
 - Identify entities
 - Measure value
 - Confirm transfer completion
 - Trigger tax condition
 - Record event
-

E. Platform-Level Implementation

Platforms must:

- integrate transfer detection into payment or reward systems
- apply taxation at payout or settlement
- record all taxable events

Example:

creator payout → taxable

internal view count → not taxable

F. State-Level Implementation

States must:

- define tax rate externally
- connect to value capture points
- receive taxation data in real time or batch

States do not need to:

- monitor activity
 - interpret behavior
 - estimate income
-

G. Non-Taxable Handling

Systems must explicitly ignore:

- signals (likes, views, clicks)
 - non-transfer activity
 - internal system states without transfer
-

H. Cross-Border Handling

For cross-border transfers:

- identify origin and destination
- apply jurisdiction logic externally

Framework does not enforce jurisdiction.

It ensures transfer traceability.

I. System Independence

Implementation is valid for:

- traditional payment systems
- blockchain systems
- platform economies
- AI agent economies

No system-specific modification required.

J. Minimal Compliance Condition

A system is VTTS™ compliant if:

- it detects value transfer
 - it identifies entities
 - it measures value
 - it records the transfer
 - it triggers taxation at capture point
-

K. Optional Extensions (Not Required)

- real-time tax settlement
 - automated jurisdiction routing
 - AI-based audit systems
 - public transparency layers
-

These enhance the system but are not required for minimal compliance.

L. Structural Outcome

Minimal implementation enables:

- immediate taxation
 - elimination of reporting delay
 - reduction of tax optimization
 - transparent value flow
-

M. Closing Principle

Do not track activity. Track value.

Canonical Closing Statement

A system does not need to understand behavior to apply taxation.

It only needs to detect when value moves.

VTTS™ Minimal Implementation Framework defines the smallest possible system required to make taxation real-time, verifiable, and system-native.
