

Air Integrity™

Minimal Self-Declaration Framework

This framework enables organizations to apply the Air Integrity™ Standard through simple and transparent disclosure of operational activities that may affect air conditions.

It is designed to be usable by small workshops, farms, and service businesses as well as larger operational facilities.

This framework:

- does not measure air quality
- does not certify emissions
- does not replace environmental regulation

It establishes **visible operational transparency**.

Implementation Steps

Step 1 — Identify Air-Relevant Activities

Review operational activities and determine whether any process may influence air conditions.

Possible categories include:

- combustion processes (gas, diesel, biomass, oil)
- dust-generating operations (cutting, grinding, milling, dry material handling)
- solvent or chemical use (painting, coating, cleaning agents)
- fuel-based heating systems
- industrial processing with potential air emissions
- no emission-generating activity

The applicable category must be publicly declared.

If none apply, declare:

“No active air emission-generating process.”

Step 2 — Disclose Mitigation or Control Mechanisms

Declare whether operational processes include mitigation systems.

Examples include:

- no emission control systems
- natural ventilation
- mechanical ventilation
- filtration systems
- dust separation systems
- other mitigation mechanisms

The framework requires disclosure of existing mechanisms rather than performance evaluation.

Step 3 — Declare Measurement Status

The organization must state the status of emission measurement.

Possible declarations include:

- emissions regularly measured
- emissions occasionally measured
- emissions not measured
- measurement not legally required

If measurement is not performed, this must be openly declared.

Transparency is more important than technical completeness.

Step 4 — Fuel Transparency (If Applicable)

If combustion processes are used, declare:

- primary fuel type (gas, diesel, biomass, electricity, mixed sources)
- whether renewable energy sources are used (if applicable)

No efficiency or emission calculation is required.

Step 5 — Responsibility Declaration

A public declaration confirming operational transparency must be issued.

Example statement:

"This Air Integrity™ Minimal Self-Declaration is made under the Air Integrity™ Standard. The declaring entity accepts responsibility for the transparency of the disclosed operational information."

The declaration should include:

- responsible person or organization
- declaration date
- public contact reference

The declaration may be published:

- on a website
 - within operational documentation
 - on facility information sheets
 - via QR code reference
-

Documentation Requirements

Implementation requires only:

- one operational disclosure sheet
 - one description of air-relevant activities
-

- one public responsibility declaration

No certification required.

No external audit required under the minimal implementation level.

Structural Value

Air Integrity™ transforms:

undisclosed operational reality

into

visible environmental transparency.

This strengthens:

- trust with local communities
 - operational awareness inside organizations
 - environmental accountability
 - credibility of environmental communication
-

Closing Principle

Operational honesty builds environmental trust.
