

CBAIM — Consequence-Bearing Authority

Parent Standard: Operational Authority Integrity Standard (OAIS)

Category: Governance & Enforcement

Subcategory: Consequence-Bearing Authority Governance

Type: Operational Authority Integrity Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 19 May 2026

Compatibility: OOF Methodology OS · Operational Authority Integrity Standard (OAIS) · Operational Decision Integrity Standard (ODIS) · Authority & Accountability Layer Standard (AALS) · Runtime Integrity Standard (RIS) · Operational Evidence & Auditability Standard (OEAS) · INTEGROS® — Integrity Standard · Autonomous Runtime Systems · Multi- Agent Infrastructures

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Consequence-Bearing Authority Integrity Module (CBAIM) defines the structural conditions under which operational authority affecting real operational outcomes, consequence-bearing delegation states, escalation-sensitive authority conditions, and distributed authority legitimacy remain materially stable, traceable, and operationally governable across runtime operational environments.

A system satisfies CBAIM only if:

- consequence-bearing operational authority remains materially legitimate
- runtime authority continuity preserves governance-valid alignment
- escalation-sensitive authority remains operationally traceable
- distributed authority legitimacy remains coherent
- consequence-bearing authority corruption does not destabilize
- operational legitimacy

A system that preserves runtime execution while authority affecting real operational outcomes materially destabilizes does

not satisfy CBAIM.

Module Operational Role

CBAIM defines the consequence-bearing authority governance layer of OAIS by preserving governance-valid authority legitimacy across runtime systems affecting real operational

outcomes.

Module Operational Space

CBAIM governs the consequence-bearing authority space of OAIS by preserving runtime authority legitimacy, escalation- sensitive authority continuity, distributed operational coordination, delegated authority governance, and consequence- bearing authority stability across runtime systems.

Module Function

The module applies wherever systems must preserve:

- consequence-bearing operational authority
- runtime authority legitimacy
- escalation-sensitive authority continuity
- distributed authority coordination
- delegated authority governance
- operational legitimacy continuity

Its function is to ensure that operational authority affecting real operational outcomes remains materially legitimate strongly enough to preserve governance-valid runtime execution across operational environments.

Minimum Implementation Framework

1. Define the Consequence-Bearing Authority Object

The organization must define which authority structures affecting real operational outcomes require governance preservation.

This may include:

- delegated runtime authority
 - escalation-sensitive authority pathways
 - autonomous operational authorization
 - distributed authority hierarchies
 - runtime override authority
 - consequence-bearing operational delegation
 - operational-critical authority chains
-

2. Define Consequence-Bearing Authority Conditions

The system must define the conditions under which operational authority affecting real operational outcomes remains materially stable and operationally aligned.

This includes:

- runtime authority legitimacy
 - escalation continuity
 - distributed authority coherence
-

- delegated authority stability
- governance-valid operational alignment

3. Define Consequence-Bearing Authority Corruption Detection Logic

The system must define how materially unstable authority conditions or authority corruption is identified.

This may include:

- unauthorized operational execution
- escalation-authority instability
- distributed legitimacy fragmentation
- delegated authority divergence
- consequence-bearing authority misalignment

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable consequence-bearing authority conditions.

Governance response may include:

- authority synchronization
- escalation review activation
- delegation restriction
- operational legitimacy reconstruction
- distributed coordination stabilization
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of consequence-bearing authority continuity and authority- corruption states. A system must not remain authority-valid if operational authority affecting real operational outcomes materially destabilizes while systems continue assuming governance-valid runtime legitimacy remains preserved.

Use Case 1 — Autonomous Multi-Agent Runtime

Environment

Scenario

A distributed AI infrastructure continuously delegates operational authority across autonomous runtime agents and orchestration systems.

Application

CBAIM preserves governance-valid authority legitimacy through consequence-bearing delegation governance and runtime authority continuity stabilization.

Result

The organization gains stronger operational legitimacy and reduced hidden authority corruption across distributed AI systems.

Use Case 2 — Enterprise Autonomous Execution

Infrastructure

Scenario

An enterprise runtime infrastructure continuously coordinates operational authority across distributed execution systems and adaptive operational environments.

Application

CBAIM preserves governance-valid authority continuity through distributed coordination governance and escalation- sensitive authority stabilization.

Result

The environment gains stronger operational accountability and reduced consequence-bearing authority instability across autonomous operational systems.

Canonical Closing Statement

If operational authority affecting real operational outcomes cannot remain materially legitimate across runtime environments, systems may preserve operational execution while governance-valid accountability progressively separates from operational authority continuity.
