

DAIM — Delegated Authority Integrity Module

Parent Standard: Operational Authority Integrity Standard (OAIS)

Category: Governance & Enforcement

Subcategory: Delegated Authority Integrity

Type: Operational Authority Integrity Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 19 May 2026

Compatibility: OOF Methodology OS · Operational Authority Integrity Standard (OAIS) · Operational Decision Integrity Standard (ODIS) · Authority & Accountability Layer Standard (AALS) · Runtime Integrity Standard (RIS) · Operational Evidence & Auditability Standard (OEAS) · INTEGROS® — Integrity Standard · Autonomous Runtime Systems · Multi- Agent Infrastructures

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Delegated Authority Integrity Module (DAIM) defines the structural conditions under which delegated operational authority, runtime delegation legitimacy, distributed delegation coordination, and consequence-bearing delegated authority states remain materially stable, traceable, and operationally governable across runtime operational environments.

A system satisfies DAIM only if:

- delegated operational authority remains materially legitimate
- runtime delegation continuity preserves governance-valid alignment
- distributed delegation coordination remains coherent
- consequence-bearing delegated authority remains traceable
- delegation corruption does not destabilize operational legitimacy

A system that preserves runtime execution while delegated authority materially diverges from governance-valid conditions does not satisfy DAIM.

Module Operational Role

DAIM defines the delegated authority integrity layer of OAIS by preserving governance-valid delegation continuity across runtime operational environments.

Module Operational Space

DAIM governs the delegated authority space of OAIS by preserving runtime delegation legitimacy, distributed delegation coherence, escalation delegation continuity, authority traceability, and consequence-bearing delegated authority stability across runtime systems.

Module Function

The module applies wherever systems must preserve:

- delegated authority legitimacy
- runtime delegation continuity
- distributed delegation coordination
- escalation delegation stability
- consequence-bearing delegated authority
- governance-valid operational alignment

Its function is to ensure that delegated operational authority remains materially legitimate strongly enough to preserve governance-valid runtime execution across operational environments.

Minimum Implementation Framework

1. Define the Delegated Authority Object

The organization must define which delegated operational authority structures require governance preservation.

This may include:

- delegated AI runtime authority
 - orchestration delegation pathways
 - escalation delegation routing
 - distributed operational hierarchies
 - autonomous runtime delegation
 - consequence-bearing delegated actions
 - operational-critical delegation chains
-

2. Define Delegated Authority Integrity Conditions

The system must define the conditions under which delegated operational authority remains materially stable and operationally aligned.

This includes:

- runtime delegation legitimacy
 - distributed delegation coherence
 - escalation delegation continuity
 - operational traceability
 - governance-valid authority alignment
-

3. Define Delegation Corruption Detection Logic

The system must define how materially unstable delegated authority or delegation corruption is identified.

This may include:

- unauthorized delegation
 - escalation delegation instability
 - distributed delegation fragmentation
 - authority-traceability degradation
 - consequence-bearing delegation divergence
-

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable delegated-authority conditions.

Governance response may include:

- delegation restriction
 - authority synchronization
 - escalation review activation
 - delegation reconstruction
 - distributed coordination correction
 - operational invalidation where required
-

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of delegated-authority continuity and delegation-corruption states. A system must not remain authority-valid if delegated operational authority materially diverges from governance-valid legitimacy while systems continue assuming runtime authority continuity remains preserved.

Use Case 1 — Multi-Agent AI Delegation

Environment

Scenario

A distributed AI infrastructure continuously delegates operational authority across autonomous runtime agents and orchestration systems.

Application

DAIM preserves governance-valid delegation continuity through distributed delegation governance and runtime authority legitimacy stabilization.

Result

The organization gains stronger delegation accountability and reduced unauthorized operational delegation across distributed AI systems.

Use Case 2 — Autonomous Operational

Coordination Infrastructure

Scenario

An autonomous operational infrastructure continuously routes delegated authority across distributed runtime systems and adaptive execution environments.

Application

DAIM preserves governance-valid delegation legitimacy through escalation delegation governance and distributed authority coordination continuity.

Result

The environment gains stronger runtime delegation stability and reduced delegation-corruption instability across autonomous operational systems.

Canonical Closing Statement

If delegated operational authority cannot remain materially legitimate across runtime environments, systems may preserve operational execution while governance-valid delegation continuity progressively separates from operational accountability.
