

Authority Escalation Module (AESM)

OriginID: OOF-OID-OBID-AIS-AESM-2026-07-12-0004
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Authority Escalation
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Authority Integrity Standard Module
Parent Standard: Authority Integrity Standard (AIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Authority Escalation Module (AESM) defines the structural conditions under which governance authority over a governed identity is escalated to a higher legitimate authority while preserving governance integrity, accountability, traceability, and continuous governability throughout the complete identity lifecycle.

AESM governs authority escalation.

The module establishes the governance conditions required to ensure that authority is escalated only when predefined governance conditions require higher-level authorization or intervention.

Not every authority may decide everything.

Governance defines when authority must escalate.

AESM governs that escalation.

Module Operational Role

AESM defines the authority escalation layer of AIS.

Its role is to ensure that governance decisions exceeding delegated authority are transferred to the appropriate governance level.

Module Operational Space

AESM governs:

- authority escalation,
 - governance escalation,
 - higher-level authorization,
 - escalation conditions,
 - escalation pathways,
 - authority transition,
 - governance intervention,
 - escalation traceability.
-

Module Function

The module applies wherever governance authority must be escalated beyond the authority currently assigned to a governed identity.

Minimum Implementation Framework

1. Define the Escalation Object

Identify the governance decisions or actions requiring authority escalation.

2. Define Escalation Conditions

Establish governance conditions governing when, how, and to whom authority must be escalated.

3. Define Escalation Failure Logic

Identify conditions where authority escalation becomes bypassed, delayed, unauthorized, incomplete, or governance- invalid.

4. Define Governance Response

Define governance actions for escalation, review, approval, intervention, reassignment, or rejection.

5. Preserve Escalation Records

Preserve escalation requests, governance decisions, supporting evidence, approval history, and escalation records.

Use Case 1 — Enterprise Identity Governance

Scenario

An identity administrator requests authority to transfer ownership of a strategic digital identity.

Application

AESM escalates the request to the authorized governance authority responsible for ownership decisions.

Result

The governance decision is made by the appropriate level of authority.

Use Case 2 — AI Identity Governance

Scenario

An AI identity management platform detects a governance action beyond the authority assigned to a regional administrator.

Application

AESM escalates the governance request to the global identity governance authority.

Result

Authority remains legitimate, accountable, and continuously governable.

Canonical Closing Statement

Authority demonstrates its maturity by recognizing its limits.

Authority Escalation preserves governance integrity by ensuring that decisions always reach the authority legitimately empowered to make them throughout the complete identity lifecycle.
