

Authority Verification Module (AVAM)

OriginID: OOF-OID-OBID-AIS-AVAM-2026-07-12-0005
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Authority Verification
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Authority Integrity Standard Module
Parent Standard: Authority Integrity Standard (AIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Authority Verification Module (AVAM) defines the structural conditions under which authority over a governed identity remains authentic, legitimate, verifiable, evidence-supported, and continuously governable throughout the complete identity lifecycle.

AVAM governs authority verification.

The module establishes the governance conditions required to ensure that every exercise of authority can be independently verified before governance actions are recognized as legitimate.

Authority must not only exist.

Authority must be verifiable.

AVAM governs that verification.

Module Operational Role

AVAM defines the authority verification layer of AIS.

Its role is to verify that every governance authority remains legitimate before governance rights are exercised.

Module Operational Space

AVAM governs:

- authority verification,
 - authority authentication,
 - authority legitimacy,
 - governance verification,
 - authority evidence,
 - authority validation,
 - trusted governance authority,
 - continuous authority verification.
-

Module Function

The module applies wherever organizations must verify governance authority before permitting actions affecting a governed identity.

Minimum Implementation Framework

1. Define the Authority Verification Object

Identify the authority relationship requiring verification.

2. Define Verification Conditions

Establish governance conditions governing authority legitimacy, evidence requirements, verification methods, and governance approval.

3. Define Verification Failure Logic

Identify conditions where authority becomes unverifiable, expired, unauthorized, inconsistent, or governance-invalid.

4. Define Governance Response

Define governance actions for authority approval, rejection, suspension, investigation, revalidation, or governance escalation.

5. Preserve Verification Records

Preserve verification results, governance decisions, supporting evidence, authority history, and audit records.

Use Case 1 — Enterprise Identity Administration

Scenario

A governance administrator requests authorization to modify a strategic enterprise identity.

Application

AVAM verifies that the administrator possesses legitimate governance authority before the request is approved.

Result

Only verified authorities may perform governance actions affecting the governed identity.

Use Case 2 — Cross-Platform Identity Governance

Scenario

A governed identity is administered across multiple operational platforms.

Application

AVAM verifies the legitimacy of authority before governance actions are accepted on each platform.

Result

Authority remains trusted, consistent, and continuously governable across the complete identity lifecycle.

Canonical Closing Statement

Authority is trusted because it can be verified. Authority Verification preserves governance confidence by ensuring that every governance action is exercised only by a legitimately verified authority throughout the complete identity lifecycle.
