

Audit Trail Module (ATLM)

OriginID: OOF-OID-OBID-AUDIS-ATLM-2026-07-15-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: OBIDENITY® — Origin-Bound Identity

Governance Architecture

Operational Layer: Identity Governance Layer

Governed Space: Audit Trail

Category: Governance & Enforcement

Subcategory: Identity Governance

Type: Auditability Integrity Standard Module

Parent Standard: Auditability Integrity Standard (AUDIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 15 July 2026

Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA®

· MGIA™ · ASGA™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Audit Trail Module (ATLM) defines the structural conditions under which governance activities associated with a governed identity are chronologically recorded, preserved, reviewable, traceable, and continuously governable throughout the complete identity lifecycle.

ATLM governs audit trails.

The module establishes the governance conditions required to ensure that every governance-relevant action performed on behalf of a governed identity becomes part of a complete, trustworthy, and independently reviewable audit trail.

Governance creates records.

Audit trails preserve governance memory.

ATLM governs that record.

Module Operational Role

ATLM defines the audit trail layer of AUDIS.

Its role is to preserve a complete chronological record of governance activities associated with a governed identity.

Module Operational Space

ATLM governs:

- audit trails,
- governance records,
- chronological governance history,
- governance activity logging,
- lifecycle audit records,
- traceable governance actions,
- audit chronology,
- governance event records.

Module Function

The module applies wherever organizations must preserve complete audit trails for governed identities and their governance activities.

Minimum Implementation Framework

1. Define the Audit Trail Object

Identify the governed identity and the governance activities requiring audit trail preservation.

2. Define Audit Trail Conditions

Establish governance conditions governing audit recording, chronology, integrity, retention, traceability, and governance approval.

3. Define Audit Trail Failure Logic

Identify conditions where audit trails become incomplete, altered, inconsistent, missing, unverifiable, or governance- invalid.

4. Define Governance Response

Define governance actions for verification, reconstruction, correction, investigation, audit review, or governance escalation.

5. Preserve Audit Trail Records

Preserve governance events, audit logs, supporting evidence, timestamps, review history, and lifecycle documentation.

Use Case 1 — Enterprise Identity Governance

Scenario

An organization performs governance operations on privileged enterprise identities over several years.

Application

ATLM records every governance action within a permanent audit trail.

Result

The complete governance history remains independently reviewable and continuously governable.

Use Case 2 — AI Identity Governance

Scenario

A governed AI identity undergoes continuous operational governance, permission changes, and authority updates.

Application

ATLM preserves a complete chronological audit trail of every governance activity.

Result

Every governance action remains permanently traceable, evidence-supported, and independently verifiable throughout the complete identity lifecycle.

Canonical Closing Statement

A trustworthy governance system leaves no invisible decisions behind.

Audit Trail preserves governance confidence by ensuring that every significant action becomes part of a permanent, traceable, and independently reviewable identity history.
