

Evidence Verification Module (EVRM)

OriginID: OOF-OID-OBID-AUDIS-EVRM-2026-07-15-0002
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity
Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Evidence Verification
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Auditability Integrity Standard Module
Parent Standard: Auditability Integrity Standard (AUDIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 15 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA®
· MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Evidence Verification Module (EVRM) defines the structural conditions under which evidence supporting a governed identity is independently verified, authenticated, validated, and continuously governable throughout the complete identity lifecycle.

EVRM governs evidence verification.

The module establishes the governance conditions required to ensure that governance evidence remains authentic, reliable, complete, independently verifiable, and suitable for governance decisions.

Evidence supports governance.

Verification confirms evidence.

EVRM governs that verification.

Module Operational Role

EVRM defines the evidence verification layer of AUDIS.

Its role is to verify that governance evidence supporting a governed identity remains authentic and trustworthy.

Module Operational Space

EVRM governs:

- evidence verification,
 - governance evidence,
 - evidence authentication,
 - evidence validation,
 - governance proof,
 - evidence review,
 - evidence assurance,
 - trusted governance evidence.
-

Module Function

The module applies wherever organizations must independently verify evidence supporting the governance of a governed identity.

Minimum Implementation Framework

1. Define the Evidence Verification Object

Identify the governance evidence requiring independent verification.

2. Define Verification Conditions

Establish governance conditions governing evidence authenticity, completeness, consistency, traceability, and validation.

3. Define Verification Failure Logic

Identify conditions where evidence becomes incomplete, altered, unreliable, unverifiable, inconsistent, or governance- invalid.

4. Define Governance Response

Define governance actions for verification, investigation, correction, rejection, revalidation, or governance escalation.

5. Preserve Verification Records

Preserve verification results, governance decisions, supporting evidence, review history, validation records, and audit documentation.

Use Case 1 — Enterprise Identity Governance

Scenario

An organization reviews evidence supporting ownership and authority changes associated with a strategic governed identity.

Application

EVRM independently verifies the authenticity and integrity of the supporting governance evidence.

Result

Governance decisions rely only on verified and trustworthy evidence.

Use Case 2 — Cross-Platform AI Identity

Scenario

A governed AI identity accumulates governance evidence across multiple operational platforms.

Application

EVRM verifies the authenticity and consistency of the collected evidence before governance decisions are approved.

Result

The identity remains supported by independently verified governance evidence throughout the complete identity lifecycle.

Canonical Closing Statement

Evidence creates confidence only after it has been verified. Evidence Verification preserves governance trust by ensuring that every governance decision rests upon authentic, independently validated, and continuously trustworthy evidence throughout the complete identity lifecycle.
