

Auditability Integrity Standard (AUDIS)

OriginID: OOF-OID-OBID-AUDIS-2026-07-15-0010

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: OBIDENTITY® — Origin-Bound Identity

Governance Architecture

Operational Layer: Identity Governance Layer

Category: Governance & Enforcement

Subcategory: Identity Governance

Type: Parent Standard

Governed Space: Identity Auditability

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 15 July 2026

Compatibility: OOF Methodology OS · Governance Architecture (GOA™) ·

Operational Reality Architecture (ORA™) · Accountability Governance

Architecture (AGA™) · AI Governance Architecture (AIG®) · Cognitive

Governance Intelligence Architecture (CLIA®) · Memory Governance

Intelligence Architecture (MGIA™) · Autonomous Systems Governance

Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Identity Auditability

Core Question

Can every governance aspect of a governed identity be independently verified?

Canonical Definition

Auditability Integrity Standard (AUDIS) defines the structural conditions under which every governance aspect of a governed identity remains independently reviewable, verifiable, evidence-supported, traceable, and continuously governable throughout the complete identity lifecycle.

AUDIS governs identity auditability.

The standard establishes the governance conditions required to ensure that every governance decision, relationship, responsibility,

transfer, continuity event, and supporting evidence associated with a governed identity can be independently examined and verified.

Governance creates trust.

Auditability proves that trust.

AUDIS governs that proof.

Governance Flow Position

Origin → Identity → Ownership → Authority → Permission →
Responsibility → Provenance → Transfer → Continuity → **Auditability**

Standard Abstract

Trustworthy governance requires independent verification.

Every governed identity should be capable of demonstrating how it was created, governed, modified, transferred, and preserved throughout its lifecycle.

Without governed auditability:

- governance cannot be independently verified,
- evidence loses operational value,
- accountability weakens,
- compliance becomes uncertain,
- long-term governance trust declines.

AUDIS establishes the governance conditions required for transparent, evidence-based, and continuously verifiable identity governance.

Operational Role

Auditability Integrity Standard provides the governance layer responsible for governing how the complete governance lifecycle of a governed identity remains independently reviewable and continuously verifiable.

Its role is to ensure that every governance element remains supported by authentic evidence, complete traceability, and transparent governance records.

Operational Space

AUDIS governs:

- audit trails,
 - evidence verification,
 - relationship auditing,
-

- compliance auditing,
- integrity verification,
- governance review,
- lifecycle auditability,
- identity auditability.

This governed space ensures that identity governance remains continuously transparent, independently verifiable, and trustworthy throughout the complete identity lifecycle.

Why This Standard Exists

Governance without verification depends on trust alone.

Trustworthy governance requires evidence.

Auditability transforms governance claims into independently verifiable governance reality.

AUDIS exists because Identity Auditability represents the **tenth governable space** of **OBIDENTITY® — Origin-Bound Identity Governance Architecture**.

Scope

This standard may be applied across:

- AI identities,
 - digital identities,
 - human identities,
 - enterprise identity platforms,
 - autonomous agents,
 - robotics,
 - digital assets,
 - organizational identity systems,
 - public-sector identity infrastructures,
 - cross-platform identity ecosystems.
-

Relationship to Other OOF® Architectures

AUDIS governs identity auditability.

It interoperates with:

- **GOA™** for governance verification,
 - **ORA™** for operational auditability,
 - **AGA™** for accountability evidence,
 - **AIG®** for behavioral auditability,
-

- **CLIA®** for cognitive traceability,
- **MGIA™** for memory verification,
- **ASGA™** for autonomous operational auditability.

Together these architectures ensure that every governed identity remains independently verifiable, evidence-supported, transparent, and continuously governable throughout the complete identity lifecycle.

Foundational Principle

Trustworthy identity requires trustworthy auditability. Every governed identity must remain independently verifiable through authentic evidence, complete traceability, and transparent governance throughout its complete identity lifecycle.

Canonical Closing Statement

Governance earns trust through transparency and retains trust through verification. Auditability Integrity ensures that every governed identity can demonstrate—not merely claim—its authenticity, governance history, and integrity throughout the complete identity lifecycle.
