

Replacement Continuity Module (RECM)

OriginID: OOF-OID-OBID-CIS-RECM-2026-07-15-0005
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENTITY® — Origin-Bound Identity
Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Replacement Continuity
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Continuity Integrity Standard Module
Parent Standard: Continuity Integrity Standard (CIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 15 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA®
· MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Replacement Continuity Module (RECM) defines the structural conditions under which a governed identity may be legitimately replaced while preserving governance continuity, provenance, accountability, traceability, and continuous governability throughout the complete identity lifecycle.

RECM governs replacement continuity.

The module establishes the governance conditions required to ensure that every legitimate replacement preserves the governance integrity of the governed identity without creating discontinuity or loss of governance trust.

Replacement may change implementation.

Governance identity must remain continuous.

RECM governs that continuity.

Module Operational Role

RECM defines the replacement continuity layer of CIS.

Its role is to preserve governance continuity whenever a governed

identity or its operational representation is legitimately replaced.

Module Operational Space

RECM governs:

- identity replacement,
 - governance continuity,
 - replacement validation,
 - operational replacement,
 - lifecycle replacement,
 - governance preservation,
 - replacement traceability,
 - identity continuity.
-

Module Function

The module applies wherever governed identities require legitimate replacement because of operational, organizational, technological, or lifecycle changes.

Minimum Implementation Framework

1. Define the Replacement Object

Identify the governed identity and the component, representation, or implementation requiring replacement.

2. Define Replacement Conditions

Establish governance conditions governing replacement authorization, continuity preservation, provenance retention, verification, and governance approval.

3. Define Replacement Failure Logic

Identify conditions where replacement becomes unauthorized, incomplete, inconsistent, unverifiable, misleading, or governance-invalid.

4. Define Governance Response

Define governance actions for approval, correction, rollback, investigation, revalidation, or governance escalation.

5. Preserve Replacement Records

Preserve replacement decisions, governance approvals, provenance records, supporting evidence, lifecycle history, and continuity documentation.

Use Case 1 — Enterprise Identity Infrastructure

Scenario

An organization replaces its identity management infrastructure while preserving the same governed enterprise identities.

Application

RECM governs the replacement and validates that governance continuity remains intact.

Result

The identities continue without interruption despite the infrastructure replacement.

Use Case 2 — AI Identity Modernization

Scenario

A governed AI identity is migrated to a new AI model while retaining the same governance identity and operational responsibilities.

Application

RECM verifies that the replacement preserves governance relationships, provenance, and continuity.

Result

The governed identity remains trustworthy, attributable, and continuously governable throughout the complete identity lifecycle.

Canonical Closing Statement

Replacement should renew capability, not erase identity. Replacement Continuity preserves governance trust by ensuring that every legitimate replacement carries forward the identity, history, and governance relationships that define continuity throughout the complete identity lifecycle.
