

Continuity Integrity Standard (CIS)

OriginID: OOF-OID-OBID-CIS-2026-07-15-0009

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: OBIDENTITY® — Origin-Bound Identity

Governance Architecture

Operational Layer: Identity Governance Layer

Category: Governance & Enforcement

Subcategory: Identity Governance

Type: Parent Standard

Governed Space: Identity Continuity

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 15 July 2026

Compatibility: OOF Methodology OS · Governance Architecture (GOA™) ·

Operational Reality Architecture (ORA™) · Accountability Governance

Architecture (AGA™) · AI Governance Architecture (AIG®) · Cognitive

Governance Intelligence Architecture (CLIA®) · Memory Governance

Intelligence Architecture (MGIA™) · Autonomous Systems Governance

Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Identity Continuity

Core Question

How can a governed identity remain continuous throughout its complete lifecycle?

Canonical Definition

Continuity Integrity Standard (CIS) defines the structural conditions under which a governed identity preserves its continuity, legitimacy, traceability, provenance, governance relationships, and continuous governability throughout the complete identity lifecycle despite legitimate lifecycle changes.

CIS governs identity continuity.

The standard establishes the governance conditions required to ensure that a governed identity remains continuously recognizable,

attributable, and governance-valid across succession, inheritance, replacement, merging, and other legitimate lifecycle transitions.

Identity may evolve.

Identity may transfer.

Identity must remain continuous.

CIS governs that continuity.

Governance Flow Position

Origin → Identity → Ownership → Authority → Permission →
Responsibility → Provenance → Transfer → **Continuity** → Auditability

Standard Abstract

Governed identities are expected to exist beyond individual events, technologies, organizations, and operational environments.

Long-term governance requires continuity.

Without governed continuity:

- identity relationships become fragmented,
- governance history becomes disconnected,
- ownership succession becomes uncertain,
- long-term trust deteriorates,
- lifecycle governance cannot be preserved.

CIS establishes the governance conditions required for continuous, trustworthy, and governance-preserving identity continuity.

Operational Role

Continuity Integrity Standard provides the governance layer responsible for governing how governed identities preserve their integrity and governance relationships across legitimate lifecycle transitions.

Its role is to ensure that every governed identity remains continuously attributable, traceable, and governance-valid despite change.

Operational Space

CIS governs:

- identity succession,
 - inheritance,
-

- merge continuity,
- clone continuity,
- replacement continuity,
- lifecycle continuity,
- governance continuity,
- long-term identity preservation.

This governed space ensures that identity continuity remains compatible with trustworthy identity governance throughout the complete identity lifecycle.

Why This Standard Exists

Governed identities are designed to outlive individual owners, systems, platforms, and operational environments.

Governance must therefore preserve continuity beyond individual lifecycle events.

CIS exists because Identity Continuity represents the **ninth governable space** of **OBIDENTITY® — Origin-Bound Identity Governance Architecture**.

Scope

This standard may be applied across:

- AI identities,
- digital identities,
- human identities,
- enterprise identity platforms,
- autonomous agents,
- robotics,
- digital assets,
- organizational identity systems,
- public-sector identity infrastructures,
- cross-platform identity ecosystems.

Relationship to Other OOF® Architectures

CIS governs identity continuity.

It interoperates with:

- **GOA™** for governance continuity,
- **ORA™** for operational continuity,
- **AGA™** for accountability,
- **AIG®** for behavioral continuity,
- **CLIA®** for cognitive continuity,

- **MGIA™** for memory continuity,
- **ASGA™** for autonomous operational continuity.

Together these architectures ensure that governed identities remain continuous, trustworthy, attributable, and continuously governable throughout legitimate lifecycle changes.

Foundational Principle

Trustworthy identity requires trustworthy continuity. Every governed identity must preserve its governance integrity across every legitimate lifecycle transition.

Canonical Closing Statement

Identity is not defined by a single moment, but by its uninterrupted continuity over time. Continuity Integrity preserves governance trust by ensuring that every governed identity remains continuously recognizable, attributable, and governable throughout its complete identity lifecycle.

Module Architecture
