

Identity Resolution Module (IRSM)

OriginID: OOF-OID-OBID-IIS-IRSM-2026-07-12-0004
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Identity Resolution
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Identity Integrity Standard Module
Parent Standard: Identity Integrity Standard (IIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Identity Resolution Module (IRSM) defines the structural conditions under which a governed identity can be uniquely resolved, accurately recognized, correctly matched, and continuously governable throughout the complete identity lifecycle.

IRSM governs identity resolution.

The module establishes the governance conditions required to ensure that every governed identity can be resolved to the correct governed entity without ambiguity, conflict, or misidentification.

Identity must be unique.

Identity must also be resolvable.

IRSM governs that resolution.

Module Operational Role

IRSM defines the identity resolution layer of IIS.

Its role is to ensure that every governed identity can be accurately identified and resolved whenever governance decisions require identity verification.

Module Operational Space

IRSM governs:

- identity resolution,
- identity matching,
- identity recognition,
- identity conflict resolution,
- governance identity lookup,
- identity correlation,
- governed identity resolution,
- trustworthy identity recognition.

Module Function

The module applies wherever organizations must accurately resolve a governed identity to the correct governed entity across one or more operational environments.

Minimum Implementation Framework

1. Define the Identity Resolution Object

Identify the governed identity that must be resolved.

2. Define Resolution Conditions

Establish governance conditions governing identity matching, recognition, correlation, and resolution accuracy.

3. Define Resolution Failure Logic

Identify conditions where identity resolution becomes ambiguous, conflicting, incorrect, incomplete, or governance-invalid.

4. Define Governance Response

Define governance actions for identity verification, conflict resolution, manual review, correction, or governance escalation.

5. Preserve Resolution Records

Preserve identity resolution results, governance decisions, conflict history, supporting evidence, and related documentation.

Use Case 1 — Multi-Platform AI Identity

Scenario

A governed AI identity operates across several independent operational platforms.

Application

IRSM resolves the identity to the correct governed entity before governance actions are performed.

Result

The correct identity is consistently recognized across all governed environments.

Use Case 2 — Enterprise Identity Federation

Scenario

A multinational organization integrates multiple identity systems into a unified governance framework.

Application

IRSM resolves identities originating from different systems to the appropriate governed identity.

Result

Identity conflicts are eliminated while governance remains accurate and consistent.

Canonical Closing Statement

A unique identity has little value if it cannot be reliably recognized. Identity Resolution ensures that every governance decision begins with the correct governed identity.
