

Identity Validation Module (IVAM)

OriginID: OOF-OID-OBID-IIS-IVAM-2026-07-12-0002
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Identity Validation
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Identity Integrity Standard Module
Parent Standard: Identity Integrity Standard (IIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Identity Validation Module (IVAM) defines the structural conditions under which a governed identity remains valid, authentic, verifiable, and continuously governable throughout the complete identity lifecycle.

IVAM governs identity validation.

The module establishes the governance conditions required to ensure that every governed identity can be independently verified before it is accepted, trusted, or used within governed environments.

Identity claims require validation.

Governance verifies those claims.

IVAM governs that validation.

Module Operational Role

IVAM defines the identity validation layer of IIS.

Its role is to ensure that every governed identity satisfies predefined governance validation requirements before being recognized as a trusted identity.

Module Operational Space

IVAM governs:

- identity validation,
- identity verification,
- identity authenticity,
- validation assurance,
- governance validation,
- identity legitimacy,
- trusted identity verification,
- continuous identity validation.

Module Function

The module applies wherever organizations must verify the validity of governed identities before operational use.

Minimum Implementation Framework

1. Define the Identity Validation Object

Identify the governed identity requiring validation.

2. Define Validation Conditions

Establish governance conditions governing identity verification, authenticity, and validation requirements.

3. Define Validation Failure Logic

Identify conditions where identity becomes unverifiable, invalid, inconsistent, fraudulent, or governance-invalid.

4. Define Governance Response

Define governance actions for validation, rejection, investigation, correction, suspension, or governance escalation.

5. Preserve Validation Records

Preserve validation results, governance decisions, supporting evidence, validation history, and related documentation.

Use Case 1 — AI Identity Registration

Scenario

An enterprise AI platform registers a new governed AI identity.

Application

IVAM validates the identity before operational activation.

Result

Only verified and governance-approved identities become trusted operational identities.

Use Case 2 — Cross-Platform Identity Verification

Scenario

A governed identity is presented across multiple organizations and digital platforms.

Application

IVAM independently validates the identity before it is accepted within each governed environment.

Result

Identity trust is preserved through consistent and repeatable governance validation.

Canonical Closing Statement

A claimed identity becomes a trusted identity only after validation. Identity Validation establishes the governance confidence required for every governed identity to be recognized, accepted, and relied upon.
