

Identity Integrity Standard (IIS)

OriginID: OOF-OID-OBID-IIS-2026-07-12-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: OBIDENTITY® — Origin-Bound Identity

Governance Architecture

Operational Layer: Identity Governance Layer

Category: Governance & Enforcement

Subcategory: Identity Governance

Type: Parent Standard

Governed Space: Identity Integrity

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 12 July 2026

Compatibility: OOF Methodology OS · Governance Architecture (GOA™) ·

Operational Reality Architecture (ORA™) · Accountability Governance

Architecture (AGA™) · AI Governance Architecture (AIG®) · Cognitive

Governance Intelligence Architecture (CLIA®) · Memory Governance

Intelligence Architecture (MGIA™) · Autonomous Systems Governance

Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Identity Integrity

Core Question

What exactly is the governed identity?

Canonical Definition

Identity Integrity Standard (IIS) defines the structural conditions under which a governed identity remains unique, authentic, distinguishable, classifiable, verifiable, and continuously governable throughout its complete lifecycle.

IIS governs identity integrity.

The standard establishes the governance conditions required to ensure that every governed identity remains uniquely identifiable, consistently represented, and protected from ambiguity, duplication, substitution, or identity corruption.

Every governed identity requires a unique identity.

Governance preserves the integrity of that identity.

IIS governs that integrity.

Governance Flow Position

Origin → **Identity** → Ownership → Authority → Permission →
Responsibility → Provenance → Transfer → Continuity → Auditability

Standard Abstract

Origin establishes where a governed identity begins.

Identity establishes what the governed entity is.

Without governed identity:

- uniqueness cannot be guaranteed,
- attribution becomes unreliable,
- ownership cannot be established,
- authority becomes ambiguous,
- governance loses precision.

IIS establishes the governance conditions required for trustworthy identity integrity throughout the complete identity lifecycle.

Operational Role

Identity Integrity Standard provides the governance layer responsible for preserving the uniqueness, authenticity, classification, verification, and lifecycle integrity of governed identities.

Its role is to ensure that every governed identity remains consistently identifiable throughout its complete lifecycle.

Operational Space

IIS governs:

- identity uniqueness,
 - identity validation,
 - identity classification,
 - identity resolution,
 - identity lifecycle continuity,
 - governed identity integrity,
 - identity authenticity,
 - trustworthy identity management.
-

This governed space ensures that every identity remains unique, verifiable, and continuously governable throughout its complete lifecycle.

Why This Standard Exists

Governed identity cannot exist without a trustworthy identity.

Origin establishes where identity begins.

Identity establishes what exists.

IIS exists because Identity Integrity represents the **second governable space** of **OBIDENTITY® — Origin-Bound Identity Governance Architecture**.

Scope

This standard may be applied across:

- AI identities,
- autonomous agents,
- robotics,
- digital assets,
- organizations,
- human digital identities,
- enterprise identity systems,
- public-sector identity infrastructures,
- critical infrastructure,
- future intelligent ecosystems.

Relationship to Other OOF® Architectures

IIS governs identity integrity.

It interoperates with:

- **GOA™** for governance principles,
- **ORA™** for operational reality,
- **AGA™** for accountability,
- **AIG®** for behavioral governance,
- **CLIA®** for cognition,
- **MGIA™** for memory governance,
- **ASGA™** for autonomous operational governance.

Together these architectures ensure that governed identities remain unique, authentic, attributable, and continuously governable

throughout their complete lifecycle.

Foundational Principle

Trustworthy governance requires trustworthy identity. Every governed identity must remain unique, authentic, verifiable, and continuously governable throughout its complete lifecycle.

Canonical Closing Statement

Identity transforms origin into a governable entity. By preserving identity integrity, IIS ensures that every governed identity remains unique, distinguishable, authentic, and trustworthy as it progresses through ownership, authority, responsibility, and every subsequent governance relationship.

Module Architecture

→ Identity Uniqueness Integrity Module (IUIM)

→ Identity Validation Module (IVAM)

→ Identity Classification Module (ICLM)

→ Identity Resolution Module (IRSM)

→ Identity Lifecycle Continuity Module (ILCM)
