

Origin Provenance Attribution Module (OPAM)

OriginID: OOF-OID-OBID-OIS-OPAM-2026-07-12-0005
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Origin Provenance Attribution
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Origin Integrity Standard Module
Parent Standard: Origin Integrity Standard (OIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Origin Provenance Attribution Module (OPAM) defines the structural conditions under which the provenance of a governed identity remains attributable, traceable, verifiable, and continuously governable throughout the complete identity lifecycle.

OPAM governs origin provenance attribution.

The module establishes the governance conditions required to ensure that every governed identity maintains a provable relationship between its origin, provenance history, and legitimate attribution.

Origin establishes existence.

Provenance preserves history.

OPAM governs that attribution.

Module Operational Role

OPAM defines the origin provenance attribution layer of OIS.

Its role is to preserve trustworthy attribution between a governed identity, its legitimate origin, and its complete provenance history.

Module Operational Space

OPAM governs:

- origin provenance attribution,
- provenance linkage,
- origin attribution,
- provenance verification,
- provenance traceability,
- governance attribution,
- historical identity linkage,
- trustworthy provenance governance.

Module Function

The module applies wherever organizations must preserve verifiable attribution between a governed identity and its complete provenance history.

Minimum Implementation Framework

1. Define the Provenance Attribution Object

Identify the provenance information that must remain attributable to the governed identity.

2. Define Provenance Attribution Conditions

Establish governance conditions governing provenance attribution, verification, continuity, and traceability.

3. Define Provenance Failure Logic

Identify conditions where provenance becomes incomplete, inconsistent, unverifiable, manipulated, or governance-invalid.

4. Define Governance Response

Define governance actions for provenance verification, correction, investigation, reconciliation, or governance escalation.

5. Preserve Provenance Attribution Records

Preserve provenance records, attribution history, governance decisions, verification evidence, and supporting documentation.

Use Case 1 — AI Digital Identity

Scenario

A governed AI identity operates across multiple platforms while

generating a long operational history.

Application

OPAM preserves verifiable attribution linking every provenance event back to the original governed identity.

Result

The complete provenance history remains trustworthy, attributable, and continuously governable.

Use Case 2 — Digital Asset Ownership

Scenario

A governed digital asset changes custodians several times during its lifecycle.

Application

OPAM preserves continuous provenance attribution connecting every ownership event to the original governed origin.

Result

The asset maintains a complete, verifiable, and governance-valid provenance history.

Canonical Closing Statement

Origin explains where identity begins. Provenance explains how identity arrived here. Origin Provenance Attribution preserves that complete governance story from the first verified origin to the latest governed state.
