

Usage Permission Validation Module (UPVM)

OriginID: OOF-OID-OBID-PIS-UPVM-2026-07-12-0002
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Usage Permission Validation
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Permission Integrity Standard Module
Parent Standard: Permission Integrity Standard (PIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Usage Permission Validation Module (UPVM) defines the structural conditions under which permissions governing the use of a governed identity remain legitimate, valid, verifiable, enforceable, and continuously governable throughout the complete identity lifecycle.

UPVM governs usage permission validation.

The module establishes the governance conditions required to ensure that every authorized use of a governed identity remains consistent with approved permissions and governance policies.

Permission grants access.

Validation confirms legitimate use.

UPVM governs that validation.

Module Operational Role

UPVM defines the usage permission validation layer of PIS.

Its role is to verify that every use of a governed identity remains authorized before governance actions are performed.

Module Operational Space

UPVM governs:

- usage permission validation,
 - authorized identity use,
 - permission verification,
 - usage authorization,
 - governance validation,
 - permission compliance,
 - controlled identity usage,
 - continuous permission verification.
-

Module Function

The module applies wherever organizations must verify that the use of a governed identity complies with approved permissions.

Minimum Implementation Framework

1. Define the Usage Permission Object

Identify the governed identity usage requiring permission validation.

2. Define Validation Conditions

Establish governance conditions governing authorized usage, permission scope, verification requirements, and governance compliance.

3. Define Validation Failure Logic

Identify conditions where identity usage becomes unauthorized, excessive, inconsistent, expired, or governance-invalid.

4. Define Governance Response

Define governance actions for approval, denial, restriction, suspension, investigation, or governance escalation.

5. Preserve Validation Records

Preserve permission validation results, governance decisions, supporting evidence, usage history, and audit records.

Use Case 1 — Enterprise Identity Platform

Scenario

A governance administrator attempts to perform an operation using a governed identity.

Application

UPVM verifies that the requested operation is covered by the administrator's approved permissions.

Result

Only governance-approved identity usage is permitted.

Use Case 2 — AI Identity Operations

Scenario

An autonomous AI service requests permission to perform a specific operational task using a governed identity.

Application

UPVM validates that the requested usage complies with assigned governance permissions.

Result

Identity usage remains legitimate, controlled, and continuously governable throughout the complete identity lifecycle.

Canonical Closing Statement

Permission retains its value only while it remains valid. Usage Permission Validation ensures that every authorized use of a governed identity continues to respect the governance conditions under which permission was granted.
