

Responsibility Role Assignment Module (RRAM)

OriginID: OOF-OID-OBID-RIS-RRAM-2026-07-12-0001
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: OBIDENITY® — Origin-Bound Identity
Governance Architecture
Operational Layer: Identity Governance Layer
Governed Space: Responsibility Role Assignment
Category: Governance & Enforcement
Subcategory: Identity Governance
Type: Responsibility Integrity Standard Module
Parent Standard: Responsibility Integrity Standard (RIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA®
· MGIA™ · ASGA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Responsibility Role Assignment Module (RRAM) defines the structural conditions under which responsibility roles associated with a governed identity are established, assigned, recorded, and continuously governable throughout the complete identity lifecycle.

RRAM governs responsibility role assignment.

The module establishes the governance conditions required to ensure that every governance responsibility is assigned to clearly identifiable and legitimately authorized participants.

Responsibility must never be assumed.

Responsibility must be explicitly assigned.

RRAM governs that assignment.

Module Operational Role

RRAM defines the responsibility role assignment layer of RIS.

Its role is to establish legitimate governance responsibilities before actions are performed on behalf of a governed identity.

Module Operational Space

RRAM governs:

- responsibility role assignment,
 - governance responsibility,
 - accountable role assignment,
 - responsibility attribution,
 - governance role definition,
 - operational responsibility,
 - responsibility registration,
 - identity responsibility assignment.
-

Module Function

The module applies wherever organizations must establish and govern responsibility roles associated with a governed identity.

Minimum Implementation Framework

1. Define the Responsibility Object

Identify the governed identity and the responsibility requiring assignment.

2. Define Responsibility Assignment Conditions

Establish governance conditions governing how responsibility roles are assigned, approved, documented, and maintained.

3. Define Assignment Failure Logic

Identify conditions where responsibility becomes ambiguous, duplicated, missing, unauthorized, or governance-invalid.

4. Define Governance Response

Define governance actions for assignment, correction, reassignment, escalation, or governance review.

5. Preserve Responsibility Records

Preserve responsibility assignments, governance decisions, supporting evidence, assignment history, and accountability records.

Use Case 1 — Enterprise Identity Governance

Scenario

An organization appoints an identity governance manager responsible for a strategic digital identity.

Application

RRAM assigns the governance responsibility before operational management begins.

Result

Responsibility is clearly attributable, documented, and continuously governable.

Use Case 2 — Autonomous AI Identity

Scenario

An enterprise deploys a governed AI identity managed by multiple operational teams.

Application

RRAM assigns defined governance responsibilities to each authorized participant.

Result

Every governance responsibility remains clearly attributable throughout the complete identity lifecycle.

Canonical Closing Statement

Governance begins when responsibility becomes explicit. Responsibility Role Assignment ensures that every governed identity is connected to clearly defined and continuously governable responsibility from the very beginning of its lifecycle.
