

Responsibility Integrity Standard (RIS)

OriginID: OOF-OID-OBID-RIS-2026-07-12-0006

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: OBIDENTITY® — Origin-Bound Identity

Governance Architecture

Operational Layer: Identity Governance Layer

Category: Governance & Enforcement

Subcategory: Identity Governance

Type: Parent Standard

Governed Space: Identity Responsibility

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 12 July 2026

Compatibility: OOF Methodology OS · Governance Architecture (GOA™) ·

Operational Reality Architecture (ORA™) · Accountability Governance

Architecture (AGA™) · AI Governance Architecture (AIG®) · Cognitive

Governance Intelligence Architecture (CLIA®) · Memory Governance

Intelligence Architecture (MGIA™) · Autonomous Systems Governance

Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Identity Responsibility

Core Question

Who remains responsible for a governed identity and its governed actions?

Canonical Definition

Responsibility Integrity Standard (RIS) defines the structural conditions under which responsibility associated with a governed identity remains legitimate, attributable, verifiable, continuous, and continuously governable throughout the complete identity lifecycle.

RIS governs identity responsibility.

The standard establishes the governance conditions required to ensure that every governed identity has clearly attributable, continuously traceable, and governance-valid responsibility throughout its

complete lifecycle.

Authority determines who may act.

Responsibility determines who remains accountable for those actions.

RIS governs that responsibility.

Governance Flow Position

Origin → Identity → Ownership → Authority → Permission →

Responsibility → Provenance → Transfer → Continuity → Auditability

Standard Abstract

Every governed action produces responsibility.

Every governance decision creates accountable participants.

Without governed responsibility:

- accountability becomes fragmented,
- responsibility may become ambiguous,
- governance obligations may be avoided,
- operational trust declines,
- governance reconstruction becomes difficult.

RIS establishes the governance conditions required for legitimate, attributable, and continuously governable responsibility.

Operational Role

Responsibility Integrity Standard provides the governance layer responsible for governing how responsibility is assigned, shared, transferred, preserved, and continuously governed throughout the complete identity lifecycle.

Its role is to ensure that every governance responsibility remains legitimate, attributable, traceable, and governance- approved.

Operational Space

RIS governs:

- responsibility assignment,
 - shared responsibility,
 - responsibility escalation,
 - responsibility continuity,
 - consequence attribution,
 - governance responsibility,
 - accountable participation,
-

- identity responsibility.

This governed space ensures that responsibility remains continuously compatible with trustworthy identity governance.

Why This Standard Exists

A governed identity cannot exist without clearly defined responsibility.

Ownership identifies who possesses the identity.

Authority determines who may govern it.

Permissions determine what may be done.

Responsibility determines who remains answerable for governance outcomes.

RIS exists because Identity Responsibility represents the **sixth governable space** of **OBIDENTITY® — Origin-Bound Identity Governance Architecture**.

Scope

This standard may be applied across:

- AI identities,
 - digital identities,
 - human identities,
 - enterprise identity platforms,
 - autonomous agents,
 - robotics,
 - digital assets,
 - organizational identity systems,
 - public-sector identity infrastructures,
 - cross-platform identity ecosystems.
-

Relationship to Other OOF® Architectures

RIS governs identity responsibility.

It interoperates with:

- **GOA™** for governance responsibility,
 - **ORA™** for operational responsibility,
 - **AGA™** for accountability,
 - **AIG®** for behavioral governance,
-

- **CLIA®** for cognition,
- **MGIA™** for memory governance,
- **ASGA™** for autonomous operational responsibility.

Together these architectures ensure that responsibility remains legitimate, attributable, continuous, and continuously governable throughout the complete identity lifecycle.

Foundational Principle

Trustworthy identity requires trustworthy responsibility. Every governed identity must remain connected to clearly attributable responsibility throughout the complete identity lifecycle.

Canonical Closing Statement

Authority enables action. Responsibility preserves accountability. Responsibility Integrity ensures that every governed identity remains connected to those responsible for its governance, decisions, and consequences throughout the complete identity lifecycle.

Module Architecture
